45 **About the SunSpec Alliance**

46 The SunSpec Alliance is a trade alliance of developers, manufacturers, operators, and service
47 providers together pursuing open information standards for the distributed energy industry.
48 SunSpec standards address most operational aspects of PV, storage, and other distributed
49 energy power plants on the smart grid, including residential, commercial, and utility-scale
50 systems, thus reducing cost, promoting innovation, and accelerating industry growth.

51 Over 100 organizations are members of the SunSpec Alliance, including global leaders from
52 Asia, Europe, and North America. Membership is open to corporations, non-profits, and
53 individuals. For more information about the SunSpec Alliance, or to download SunSpec
54 specifications at no charge, visit sunspec.org.

55 **About the SunSpec Specification Process**

56 SunSpec Alliance specifications are initiated by SunSpec members to establish an industry
57 standard for mutual benefit. Any SunSpec member can propose a technical work item. Given
58 sufficient interest and time to participate, and barring significant objections, a workgroup is
59 formed and its charter is approved by the board of directors. The workgroup meets regularly to
60 advance the agenda of the team.

61 The output of the workgroup is generally in the form of a SunSpec Interoperability Specification.
62 These documents are considered to be normative, meaning that there is a matter of
63 conformance required to support interoperability. The revision and associated process of
64 managing these documents is tightly controlled. Other documents are informative, or make
65 some recommendation with regard to best practices, but are not a matter of conformance.
66 Informative documents can be revised more freely and more frequently to improve the quality
67 and quantity of information provided.

68 SunSpec Interoperability Specifications follow a lifecycle pattern of: DRAFT, TEST,
69 APPROVED, and SUPERSEDED.

70 For more information or to download a SunSpec Alliance specification, go to
71 <https://sunspec.org/about-sunspec-specifications/>.

127 [1] IETF, RFC 2119, "Keys words for use in RFCs to Indicate Requirement Levels", March
128 1997. <http://www.ietf.org/rfc/rfc2119.txt>.

129

130 **3 Definitions, abbreviations and terminology**

131 **3.1 Definitions**

132 For the purposes of the present document, the following terms and definitions apply:

133 None

134 **3.2 Abbreviations**

135 For the purposes of the present document, the following abbreviations apply:

136 DER Distributed energy resource

137 SWUP Software Updates

138 **3.3 Terminology**

139 The specification lists a series of requirements, either explicitly or within the text, which are
140 mandatory elements for compliant solutions. Recommendations are given, to ensure optimal
141 usage and to provide suitable performance. All recommendations are optional.

142 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",
143 "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are following
144 the notation as described in RFC 2119 [1\[1\]](#).

- 145 1. MUST: This word, or the terms "REQUIRED" or "SHALL", means that the definition is an
146 absolute requirement of the specification.
- 147 2. MUST NOT: This phrase, or the phrase "SHALL NOT", means that the definition is an
148 absolute prohibition of the specification.
- 149 3. SHOULD: This word, or the adjective "RECOMMENDED", means that there may exist
150 valid reasons in particular circumstances to ignore a particular item, but the full
151 implications must be understood and carefully weighed before choosing a different
152 course.
- 153 4. SHOULD NOT: This phrase, or the phrase "NOT RECOMMENDED" means that there
154 may exist valid reasons in particular circumstances when the particular behavior is
155 acceptable or even useful, but the full implications should be understood and the case
156 carefully weighed before implementing any behavior described with this label.
- 157 5. MAY: This word, or the adjective "OPTIONAL", means that an item is truly optional. One
158 vendor may choose to include the item because a particular marketplace requires it or
159 because the vendor feels that it enhances the product while another vendor may omit
160 the same item. An implementation which does not include a particular option MUST be
161 prepared to interoperate with another implementation which does include the option,
162 though perhaps with reduced functionality. In the same vein an implementation which
163 does include a particular option MUST be prepared to interoperate with another
164 implementation which does not include the option (except, of course, for the feature the
165 option provides.)

166 4 Requirements

167 4.1 Software Updates/Product Support

168 4.1.1 DER/SWUP/REQ-01: Software Updates

169 *Summary*

170 The DER device SHALL support updating mutable security and operational software
171 functions.

172 *Description*

173 The DER device SHALL have the ability to have software components, listed in [Table 4-1](#),
174 updated, if the respective component is installed on the device.

175 Table 4-1: Updatable Software Components

Component/Functionality	Must be updatable?
Operating system (kernel)	Yes
Operating system (non-kernel)	Yes
Boot loader	Yes
BIOS	No
Applications	Yes
Libraries	Yes
Configuration	Yes
Certificates	Yes

176

177 *Rationale*

178 The security community is constantly finding new vulnerabilities in software. These new
179 vulnerabilities are reported to the public at least 60 days after they have been found.
180 Adversaries often design attacks around these newly found vulnerabilities. Devices that are
181 not able to be updated will continue to be a target of these adversaries.

182 4.1.2 DER/SWUP/REQ-02: Remote Updates

183 *Summary*

184 The DER device SHALL have the capability to support remote updates.

185 *Description*

186 A device SHALL communicate with a remote server at least once per day to download and
187 install a software update when available. The device MAY allow a user to turn off remote
188 updates, but remote updates SHALL be active by default (default factory setting).

189 *Rationale*

190 DER devices are located on site and are not easily (or inexpensively) accessible by
191 maintenance crew for local software updates. Even if cost and resources were not a factor,
192 the time required to visit all sites and manually update software is more time than
193 adversaries need to conduct their attacks. Remote updates allow vendors and site
194 managers to trigger software updates remotely in seconds, giving adversaries much less
195 time.

196 **4.1.3 DER/SWUP/REQ-03: Automatic Updates**

197 *Summary*

198 The DER device SHALL support automated updates.

199 *Description*

200 No additional explanation

201 *Rationale*

202 Without automated updates a user needs to manually trigger a device to obtain an update. If
203 thousands of devices are in the field, this takes too much time even if the update can be
204 triggered remotely and even if the user acts quickly when an update is available.

205 **4.1.4 DER/SWUP/REQ-04: Secure Updates**

206 *Summary*

207 The DER device SHALL verify the authenticity and integrity of software updates, prior to
208 installing it.

209 *Description*

210 The DER device SHALL use a mechanism that verifies that the software update package
211 came from a trusted source, such as the manufacturer. An example of an authentication
212 mechanism is a cryptographic signature. The DER device SHALL verify that the software
213 update package was not modified by a third party. An example of an integrity mechanism is
214 a checksum or hash.

215 *Rationale*

216 Attacking the software update system is commonly used by adversaries, and can allow an
217 adversary to gain complete control over a device. Checking the authenticity (the
218 creator/author) and integrity (the package has not been modified) of a package prevents
219 such attacks.

220 **4.1.5 DER/SWUP/REQ-05: Downgrade Prevention**

221 *Summary*

222 The DER device SHALL prevent firmware downgrade attacks, i.e., prevent updates to
223 previous software versions. Vendors SHALL keep the previous software images for
224 rollbacks and package them as new updates when a rollback is needed.

225 *Description*

226 The DER device SHALL reject all software updates that are older than the currently installed
227 software. If a vendor wishes to rollback to a previous version, the previous version software
228 must be re-packaged as the most recent version.

229 *Rationale*

230 If an adversary can install a previous version of software that contains known vulnerabilities,
231 the adversary can successfully attack the device once the device is using the previous
232 version. If a new software update causes more problems for the device than it aims to fix,
233 the manufacturer needs to take a previous version of the software out of archive and re-
234 package it as a newer software update. This will give time for vendors to fix the problematic
235 software update.

236 **4.1.6 DER/SWUP/REQ-06: Local Updates**

237 *Summary*

238 If the DER device supports local updates, then this functionality SHALL comply with the
239 same security requirements of the remote update functionality.

240 *Description*

241 No other explanation necessary.

242 *Rationale*

243 Same as the Secure Updates requirement.

244 **4.2 Device Communications**

245 **4.2.1 DER/DCOM/REQ-01: Secure Communications**

246 *Summary*

247 The DER device SHALL implement at least one of TLS 1.2 (or higher), IPSec Version 2 (or
248 higher), or SSH-2 for all communications that can access the open Internet.

249 *Description*

250 Any DER device functionality that can communicate over the open Internet MUST be
251 secured by the latest versions of either TLS, IPSec, or SSH. This includes not only default
252 functionality but also optional or configurable functionality. For example, if a DER device can
253 communicate to a local device using MODBUS over a serial line, and this communication

254 functionality can also be configured to communicate MODBUS over an IP network, this
255 functionality MUST be secured.

256 TLS 1.2 (or higher), IPSec Version 2 (Committee on National Security Systems Policy 15-
257 compliant), and SSH-2 SHALL be the only allowed protocols for securing such
258 communications.

259 *Rationale*

260 Network access to a device is one of the easiest attack vectors for adversaries because an
261 adversary does not need physical access to the device to carry out an attack. Attacks can
262 modify data in transit, spoof communications from a trusted endpoint, and eavesdrop on
263 sensitive data. TLS, IPSec, and SSH are widely used and scrutinized protocols that offer the
264 authentication and encryption capabilities that prevent these attacks, and the required
265 versions are specified because previous versions of these protocols contain vulnerabilities.
266 While there are other protocols that have the same capabilities of TLS, IPSec, and SSH they
267 do not receive the same scrutiny and are therefore considered less trustworthy.

268 **4.2.2 DER/DCOM/REQ-02: Downgrade Prevention**

269 *Summary*

270 The DER device SHALL configure the minimum required version of the cryptographic
271 protocol that is used and reject connections and requests to use older protocol versions.

272 *Description*

273 A DER device that is configured to use TLS 1.2 MUST reject requests to use TLS 1.1 or
274 lower. A device configured for IPSEC Version 2 MUST reject requests to use other IPSEC
275 versions and configurations. A device configured with SSH-2 MUST reject requests to use
276 previous version of SSH.

277 *Rational*

278 Downgrade attacks can compromise the security properties of TLS since previous protocol
279 versions have known vulnerabilities.

280 **4.2.3 DER/DCOM/REQ-03: Ciphersuites**

281 *Summary*

282 A DER device SHALL only use ciphersuites specified in TLS 1.3 (or higher) or IEEE 2030.5-
283 2018 (or higher)

284 *Description*

285 TLS 1.2 contains ciphersuites that have been found to be vulnerable. TLS 1.3 removes
286 these ciphersuites. TLS 1.2 implementations must only use TLS 1.3 ciphersuites. IEEE
287 2030.5-2018 also defines a ciphersuite that is also allowed (TLS_ECDHE_ECDSA_WITH
288 _AES_128_CCM_8 using elliptic curve secp256r1).

289 *Rationale*

290 TLS 1.3 is not yet widely supported in software libraries. TLS 1.2 is widely supported, and it
291 is straightforward to remove support for ciphersuites that are not specified in TLS 1.3 and
292 IEEE 2030.5-2018.

293 **4.3 Authentication**

294 **4.3.1 DER/AUTH/REQ-01: Unique Credentials**

295 *Summary*

296 The DER device SHALL require the use of unique security credentials (such as passwords
297 or keys) for each level of privilege and user account available on the Device.

298 *Description*

299 If the DER device has multiple access levels or multiple user accounts, it MUST support
300 unique security credentials for each access level and user account.

301 *Rationale*

302 Sharing credentials among multiple users is generally not a good security practice. A device
303 must allow for different credentials for each security access level and user. However, if a
304 user wants to use the same credentials across access levels and user accounts, the device
305 is allowed to accommodate this desire. In this case the user could use a secure password
306 management application to mitigate the risks of using shared credentials.

307 **4.3.2 DER/AUTH/REQ-02: Authentication**

308 *Summary*

309 All electronic access to the device, whether locally through a control panel or diagnostic
310 port, or remotely through communications channels, SHALL be protected with an
311 authentication mechanism that securely identifies a subject with a unique user identification
312 (ID).

313 *Description*

314 This requirement specifies that a device MUST have the ability to differentiate between
315 different users (with an ID) and authenticate them securely. The authentication means is not
316 specified, but MUST be secure. If passwords are used as the authentication mechanism,
317 they MUST comply with the requirements in this document. There are also many
318 passwordless authentication mechanisms such as X.509 certificates, unique login codes
319 sent out-of-band, and use of FIDO compatible devices. See references below for details.

320 *Rationale*

321 Authenticating a user's electronic access to a device prevents installation of malicious code,
322 unauthorized access to data, and control of a device by an adversary. Unique IDs are
323 required for many of these authentication methods, and allow devices to allocate different
324 permissions to different users.

325 *References*

326 [NIST Special Publication 800-63B](#)

327 **4.3.3 DER/AUTH/REQ-03: Session Timeout**

328 *Summary*

329 All authenticated sessions SHALL have a timeout.

330 *Description*

331 The DER device MUST have a timeout feature that automatically logs out a user who
332 remains logged in after a period of inactivity. Inactivity SHALL be defined as the absence of
333 input from local or remote DER interfaces and endpoints.

334 *Rationale*

335 This requirement addresses sessions wherein the user can be replaced by an adversary.
336 For example, if a user logs into an admin panel (physically on the device or via remote
337 computer) and the user walks away without logging off, an adversary who gains access to
338 the panel can start an attack.

339 **4.3.4 DER/AUTH/REQ-04: Configurable Timeout**

340 *Summary*

341 The length of time before a session automatically times out SHALL be settable by an
342 authorized user.

343 *Description*

344 This requirement states that a device MUST give an authorized user the capability to
345 change the session timeout period. Examples of this capability include a configuration
346 screen on a physical panel or a configuration API.

347 *Rationale*

348 The ideal timeout period is dependent on the characteristics of the site where the device is
349 installed. If the device is within a secured perimeter the timeout period can be longer. The
350 timeout for a remote technician can also be longer if the technician's computer has access
351 control. A physical admin panel in a public space MAY require a shorter timeout period.

352 **4.3.5 DER/AUTH/REQ-05: Strong Passwords**

353 *Summary*

354 If a DER device uses passwords for authentication, then the DER device SHALL enforce
355 strong passwords and SHALL notify users if they attempt to use a weak password.

356 *Description*

357 Compliance with this requirement SHALL be achieved in one of two ways:

- 358 1. Password strength meter: Device implements a password strength meter that follows
359 NIST password recommendations (5.1.1.2 of the NIST Special Publication 800-63B).
360 Only passwords deemed by the strength meter to be “strong” SHALL be allowed.
- 361 2. Password MUST meet the following set of rules to be allowed:
- 362 ○ At least 8 characters in length, and the device MUST allow passwords up to
 - 363 64 characters in length
 - 364 ○ Case sensitive

365 *Rationale*

366 Passwords are an often-used attack vector for adversaries. Strong passwords prevent basic
367 password attacks. The latest password research has concluded that length and entropy of a
368 password is the best predictor of strength. Requiring numbers and symbols has shown to
369 not increase the strength of a password.

370 *References*

371 [NIST Special Publication 800-63B](#)

372 **4.3.6 DER/AUTH/REQ-06: Unique Passwords**

373 *Summary*

374 If pre-installed passwords are used, then the DER device SHALL require users to create a
375 new password when they first login.

376 *Description*

377 If a DER device manufacturer loads the same password on multiple devices, then the DER
378 device MUST require the user to create a different password when the device is first
379 accessed by the user.

380 *Rationale*

381 Default common passwords are one of the most commonly used attack vectors into devices.
382 Many jurisdictions around the world have outlawed the practice of using default common
383 passwords.

384 **4.3.7 DER/AUTH/REQ-07: Brute Force Prevention**

385 *Summary*

386 The DER device SHALL support blocking authentication requests, either temporarily or
387 permanently, from an account or user after at most 10 failed password login attempts.

388 *Description*

389 After a maximum of 10 consecutive failed password login attempts to a unique user account,
390 the device MUST lock out the user for at least 5 minutes. The maximum number of
391 consecutive failed password login attempts is 10 before lock out occurs.

392 *Rationale*

393 Brute force password attacks can break even strong passwords given enough time.
394 Temporary lockouts make brute force attacks infeasible by dramatically increasing the
395 amount of time necessary to guess the correct password.

396 **4.3.8 DER/AUTH/REQ-08: Password Protection**

397 *Summary*

398 The DER device SHALL prevent storage or display of unencrypted passwords.

399 *Description*

400 The DER device MUST NOT display stored plain text passwords on screens, including the
401 local display panel, configuration software (local or remote; offline or online), web browser,
402 and terminal access. A device MUST NOT store plain text passwords in audit trails, the
403 memory area or files, or other records and configuration files. A DER device MAY display
404 the password a user enters for authentication.

405 *Rationale*

406 Passwords stored in plain text can be copied and distributed to adversaries. Adversaries
407 that gain access to the device through a lower clearance security channel could copy
408 passwords of users with much higher clearance.

409 **4.4 Device Security**

410 **4.4.1 DER/DSEC/REQ-01: Minimal Interfaces**

411 *Summary*

412 The DER device SHALL have any unneeded logical interfaces and ports removed (or
413 disabled if removal is not possible) prior to transfer of device custody.

414 *Description*

415 A device manufacturer MUST list (in PICS) all logical interfaces and ports used by the
416 device, as well as the use. Any logical interfaces and ports not on this list SHOULD be
417 removed or disabled before the device is transferred from the manufacturer's custody. The
418 manufacturer must not rely on a customer or installer to remove or disable unused logical
419 interfaces and ports. Examples of logical interfaces and ports include: USB ports, memory
420 card slots, serial ports, ethernet ports, and TCP ports (e.g.- port 5590).

421 *Rationale*

422 Many operating systems default to opening multiple ports (port 21, port 53, port 80, port 110,
423 port 23, port 139 etc.). If these ports are not used, they become targets for adversaries
424 especially if they are not secured properly. USB ports are another common attack vector.
425 Stuxnet took advantage of a USB port on a computer at a centrifuge facility.

426 **4.4.2 DER/DSEC/REQ-01: Factory Reset**

427 *Summary*

428 The DER device SHALL support a "factory reset" option for end-of-life or repurposing the
429 device.

430 *Description*

431 A factory reset option allows the owner of the device to wipe data from the device and return
432 it to the "factory setting", which is the state the device was in when it was first manufactured,
433 before giving up ownership. Software update files need not be wiped as they do not contain
434 sensitive data and fix device vulnerabilities..

435 *Rationale*

436 Over a device's lifetime in service it MAY collect and store sensitive data such as logs,
437 encrypted passwords, and configuration files. These files MAY be utilized by an adversary to
438 initiate an attack on the original owner's existing assets.

439 **4.5 Logging**

440 **4.5.1 DER/LOG/REQ-01: Logging**

441 *Summary*

442 The DER device SHALL store logs that are readable by the highest level of access control.

443 *Description*

444 No further explanation needed.

445 *Rationale*

446 Logs are required to analyze and stop security breaches.

447 **4.5.2 DER/LOG/REQ-02: Log Storage**

448 *Summary*

449 The DER device SHALL store logs locally in persistent memory.

450 *Description*

451 No further explanation needed.

452 *Rationale*

453 Logs need to survive power loss.

454 **4.5.3 DER/LOG/REQ-03: Timestamp Logs**

455 *Summary*

456 The DER device SHALL log events with a timestamp.

457 *Description*

458 No further explanation needed.

459 *Rationale*

460 Logging events with a timestamp is required for security forensics.

461 **4.5.4 DER/LOG/REQ-04: Timestamp Resolution**

462 *Summary*

463 The DER device SHALL timestamp logs with a resolution of at least 1 millisecond.

464 *Description*

465 No additional explanation necessary.

466 *Rationale*

467 In order to record the order of network events a resolution of at least 1 millisecond is
468 required.

469 **4.5.5 DER/LOG/REQ-05: Timestamp Accuracy**

470 *Summary*

471 The DER device SHALL maintain time accuracy within +/- 1 min of Coordinated Universal
472 Time (UTC) for all logging timestamps.

473 *Description*

474 This requires devices to synchronize with a remote reliable information source such as a
475 cellphone service, Internet server, or GPS signal.

476 *Rationale*

477 Monitoring logs across multiple devices requires timestamps to be consistent.

478 **4.5.6 DER/LOG/REQ-06: Configuration Logs**

479 *Summary*

480 The DER device SHALL log any changes in security-related configurations.

481 *Description*

482 If interfaces and ports listed in the Minimal Interfaces requirement have modifiable security
483 settings, any change to these settings MUST be logged. Security configurations (firewalls
484 settings, etc.) MUST be logged as well.

485 *Rationale*

486 When a security-related configuration is changed the device SHOULD log this change so if
487 there is a breach remediation efforts can analyze such changes.

488 **4.5.7 DER/LOG/REQ-07: Network Logs**

489 *Summary*

490 The DER device SHALL log network traffic.

491 *Description*

492 The DER device SHALL log the following network traffic information for all interfaces and
493 ports listed in Minimal Interfaces requirement:

- 494 • Device initiated communications, including the endpoint address
- 495 • Incoming network requests, including endpoint address and request type
- 496 • Authentication messages
- 497 • Session starts, stops, and timeouts.

498 *Rationale*

499 Many adversaries launch their attacks over the network because it doesn't require physical
500 access. If an adversary successfully penetrates a device, cybersecurity remediation efforts
501 need network logs to determine the cause and effect of the breach.

502 **4.5.8 DER/LOG/REQ-08: Security Logs**

503 *Summary*

504 The DER device SHALL log security events.

505 *Description*

506 Security events MUST include: (a) successful and unsuccessful login attempts, (b) detected
507 failure of event logging, (c) software updates and changes, (d) changes to access controls
508 or accounts.

509 *Rationale*

510 This information is also needed for breach remediation.

511 **4.5.9 DER/LOG/REQ-09: Remote Logs**

512 *Summary*

513 If the DER device has communication capabilities, then it SHALL send logs to a remote
514 central repository with an upload frequency of at least once per day.

515 *Description*

516 More explanation is not necessary.

517 *Rationale*

518 Centrally-stored logs allow monitoring solutions to detect threats over a large number of
519 devices. It also reduces the storage needs of devices and allows logs to be kept for a longer
520 period of time. Last, it provides log redundancy because if a hacker accesses a device and
521 modifies or deletes the logs on the device the remote repository still has the original logs. An
522 upload frequency of once per day strikes a balance between keeping logs safe and
523 minimizing the network load.

524 **4.5.10 DER/LOG/REQ-10: Log Retention**

525 *Summary*

526 The DER device SHALL store (locally or on a remote central repository) network traffic logs
527 for 7 days and all other logs for 90 days.

528 *Description*

529 It is important to note that a manufacturer has the ability to purge log files from a device
530 every day given the Remote Logs requirement. The remote server can maintain compliance
531 with this requirement while the device can minimize its memory storage size.

532 *Rationale*

533 Some security breaches are not discovered until long after the attack was started. The Solar
534 Winds breach started months before it was discovered, but since logs were kept for a long
535 time researchers were able to understand the attack from its inception. This knowledge can
536 be used to prevent the attack from being successful in the future.

537 **4.5.11 DER/LOG/REQ-11: Incident Reporting**

538 *Summary*

539 The DER device SHALL upload security incidents to a remote central repository within one
540 minute of the incident.

541 *Description*

542 Security incidents include the following events:

- 543 • Failed authentication attempts
- 544 • Network activity that deviates from the normal range of activity
- 545 • Attempted access to protected data such as private keys

546 *Rationale*

547 If security incidents are uploaded to a remote repository, a central monitoring service can
548 detect patterns across a wide range of devices.

549 **4.5.12 DER/LOG/REQ-12: Power System Logs**

550 *Summary*

551 The DER devices SHALL store power system event logs.

552 *Description*

553 Power system event logs include at minimum: (a) when a function is enabled or disabled (b)
554 when there is a change to adjustable settings of the device, (c) when a device is power-
555 cycled.

556 *Rationale*

557 The purpose of a DER device is to manage the behavior of a DER. If an adversary has
558 control of the device, the adversary can attack the power grid by manipulating the power
559 control settings. Logging such manipulations can help detect or analyze unauthorized
560 manipulations. Logging device power cycles can also detect nefarious activity.

561 **4.5.13 DER/LOG/REQ-13: Panel Logs**

562 *Summary*

563 If the DER device has an admin panel, then it must log login activity in a manner consistent
564 with the above logging requirements.

565 *Description*

566 This requirement gives more clarity to how physical access logs are to be handled.

567 *Rationale*

568 Physical access must also be monitored, especially if the device is protecting a high-value
569 target.
