17 **Abstract**  
18 SAE J3072 defines the interactions between an EVSE and a PEV for the PEV to be granted  
19 permission to discharge to the electric grid. This document defines an IEEE 2030.5 compliant  
20 profile for implementing SAE J3072 and can be used as an implementation guide on for using  
21 IEEE 2030.5 to satisfy SAE J3072 requirements.

## 48 **About the SunSpec Alliance**

49 The SunSpec Alliance is a trade alliance of developers, manufacturers, operators, and service  
50 providers together pursuing open information standards for the distributed energy industry.  
51 SunSpec standards address most operational aspects of PV, storage, and other distributed  
52 energy power plants on the smart grid, including residential, commercial, and utility-scale  
53 systems, thus reducing cost, promoting innovation, and accelerating industry growth.

54 Over 150 organizations are members of the SunSpec Alliance, including global leaders from  
55 Asia, Europe, and North America. Membership is open to corporations, non-profits, and  
56 individuals. For more information about the SunSpec Alliance, or to download SunSpec  
57 specifications at no charge, visit <https://sunspec.org>.

## 58 **About the SunSpec Specification Process**

59 SunSpec Alliance specifications are initiated by SunSpec members to establish an industry  
60 standard for mutual benefit. Any SunSpec member can propose a technical work item. Given  
61 sufficient interest and time to participate, and barring significant objections, a workgroup is  
62 formed, and its charter is approved by the board of directors. The workgroup meets regularly to  
63 advance the agenda of the team.

64 The output of the workgroup is generally in the form of a SunSpec Interoperability Specification.  
65 These documents are normative, meaning that there is a matter of conformance required to  
66 support interoperability. The revision and associated processes of managing these documents  
67 is tightly controlled. Other documents are informative, or make some recommendation about  
68 best practices, but are not a matter of conformance. Informative documents can be revised  
69 more freely to improve both the quality and quantity of information provided.

70 SunSpec Interoperability Specifications follow a lifecycle pattern of DRAFT, TEST, APPROVED,  
71 and SUPERSEDED statuses where these terms are defined as follows:

72 DRAFT: Some time after convening a SunSpec workgroup to develop a specification, a DRAFT  
73 is published. This means that the workgroup has decided the specification is complete and  
74 ready for public review and comment, but may contain undiscovered errors. Multiple DRAFT  
75 revisions of the specification can be produced based upon the comments that are received.

76 TEST: When the workgroup decides the DRAFT specification is stable and free of normative  
77 errors, it is promoted to TEST status. TEST status means that the document is unlikely to  
78 contain significant defects and that it is ready to be implemented in demonstration projects, field  
79 tests, and early deployments. If defects of any type are discovered, they are remedied in a new  
80 TEST document and the process is repeated.

81 APPROVED: When the workgroup decides the specification has proven itself in field  
82 deployments and no additional comments have been received for some time, the document  
83 becomes an APPROVED SunSpec standard. Once APPROVED, the normative requirements in  
84 the document may not be changed.

85 SUPERCEDED: When a new specification that covers the same subject matter as an existing,  
86 APPROVED specification has reached the APPROVED stage, the original specification is  
87 labeled as SUPERCEDED. SUPERCEDED specifications remain in effect but are considered to  
88 be obsolete.

# 191 1 Introduction

192 This profile serves to assist EVSE and PEV manufacturers, operators, and system integrators to  
193 implement the SAE J3072 requirements using the IEEE 2030.5 protocol.

194 SAE J3072 establishes requirements for a grid support inverter system function which is  
195 integrated into a plug-in electric vehicle (PEV) which connects in parallel with an electric power  
196 system (EPS) by way of conductively coupled, electric vehicle supply equipment (EVSE). Refer  
197 to SAE J3072 section 1 for an overview of the scope, purpose, and background of the standard.

198 This profile applies to System Type A1 (SAE J1772 AC L2 IEEE 2030.5). Information which is  
199 defined by SAE J3072 is directly exchanged between the EVSE and PEV using P2P PLC over  
200 the SAE J1772 control pilot in accordance with SAE J2931/4. The higher OSI-layers follow SAE  
201 J2931/1 and IEEE 2030.5 to the extent needed to meet the SAE J3072 requirements.

<b>Acronym</b>	<b>Name</b>
DER	Distributed Energy Resource
DME	DER Managing Entity
DNS-SD	Domain Name Service – Service Discovery
EPS	Electric Power System
EVSE	Electric Vehicle Supply Equipment
IEEE	Institute of Electrical and Electronics Engineers
mDNS	Multicast Domain Name System
MITM	Man-in-the-Middle
OID	Object Identifier (as used by the ITU and ISO/IEC)
PEV	Plug-in Electric Vehicle
PIN	Personal Identification Number as defined by IEEE 2030.5
PLC	Power Line Carrier
RA	Router Advertisement
RS	Router Solicitation
SAE	Society of Automotive Engineers
SLAAC	Stateless Address Auto-Configuration
SLAC	Signal Level Attenuation Characterization
ULA	Unique Local Address
URI	Uniform Resource Identifier
V2G	Vehicle-to-Grid

233

Table 1 – Acronyms

## 234 **2 Guiding Principles**

235 The following principles have been used to help guide the development of this profile. From a  
236 communications perspective

- 237 1. Establish a complete profile – To achieve complete interoperability a complete profile is  
238 required including a data model, messaging model, communication protocol and  
239 security. Without a complete profile specification, it would be impossible to achieve  
240 communications interoperability without additional systems integration activities.
- 241 2. Eliminate optionality and keep to a single base specification – Optionality in the  
242 specification can serve to hinder interoperability when parties chose to implement.
- 243 3. Create a minimal specification – A simple interface serves to lower costs and improve  
244 quality.

245 Strictly focus on EVSE to PEV communications. All other communications are out of scope from  
246 the perspective of this profile.

### 247 **2.1 Scope of Profile**

248 Normally, a profile simply limits the scope of the underlying standard (i.e., IEEE 2030.5) for a  
249 specific use case (i.e., SAE J3072). However, this profile does more than this. It also serves as  
250 an implementation guide for developers. As such, this profile fills in gaps in the communications  
251 protocol as well as the functional behavior of the EVSE and the PEV that are not directly  
252 addressed in other standards. There are normative requirements defined in this profile that are  
253 not provided in SAE J3072, IEEE 2030.5, or IEEE 1547.

### 254 **2.2 Using the Profile**

255 This document is a profile of the IEEE 2030.5 communications protocol for use in implementing  
256 the SAE J3072 standard. Knowledge of SAE J3072 is needed to understand the required  
257 interactions between the EVSE and the PEV for the PEV to be authorized to discharge.  
258 Knowledge of IEEE 2030.5 is needed to understand how messages are exchanged between the  
259 EVSE and the PEV. The purpose of the message exchanges between the EVSE and the PEV is  
260 to affirmatively convey the IEEE 1547 Management Information controls to the PEV. As such,  
261 knowledge of IEEE 1547 is useful.

## 3 System Architecture Overview

This section describes the system architecture and an overview of the expected operations of the system. This section is informative, not normative. The normative profile requirements will be described in section 4.

### 3.1 System Concept

The figure below (reproduced from SAE J3072 Figure 1) provides a system concept for a plug-in electric vehicle (PEV) with an onboard inverter system interconnecting to the electric power system (EPS) by way of a conductive coupling to electric vehicle supply equipment (EVSE). Refer to SAE J3072 section 4.1 for a complete description of the system concept underlying the standard.

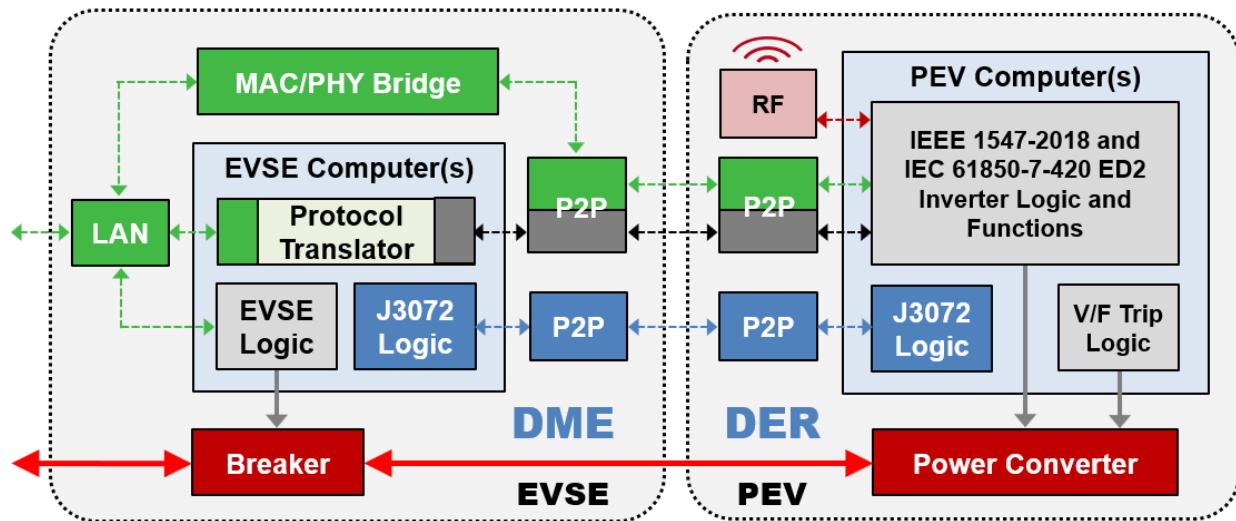

Figure 1 – System Concept

The primary focus of this document is to define requirements for the information that must be shared between the EVSE and the PEV, using the IEEE 2030.5 protocol, for the purpose of setting up the onboard inverter system for discharging at the EVSE site and for the EVSE to authorize the PEV inverter to discharge. These functions are illustrated by the dark blue boxes.

### 3.2 Security Considerations

Section 4.1.3 discusses security requirements. However, as this profile only addresses communications between the EVSE and the PEV, these requirements only consider the communications between the EVSE and the PEV and do not consider out-of-band communications to the EVSE, the PEV, or the security of the information stored on the EVSE or PEV.

### 3.3 Communications Architecture

The communications between the EVSE and the PEV is a point-to-point physical PLC link over the SAE J1772 control pilot. The PLC link supports an IEEE 802.3 physical layer and data link layer (layer 2, MAC layer). TCP/IP is expected to run on top to the link layer.

288 For multi-port EVSEs, each port is a physically separate point-to-point PLC link. From the EVSE  
289 point of view, each port appears as a separate network interface.

### 290 **3.4 Expected EVSE and PEV Operations**

291 The EVSE is an IEEE 2030.5 server that hosts all the required SAE J3072 resources for  
292 interacting with a J3072 compliant PEV. The PEV is an IEEE 2030.5 client that performs all the  
293 SAE J3072 functions required for obtaining the authorization to discharge.

294 When a PEV connects to the EVSE, the SAE J3072 authorization sequence begins. The PEV  
295 uses Service Discovery to find the EVSE server. The PEV establishes a TLS session to  
296 communicate with the EVSE server. The PEV performs Resource Discovery to find the  
297 locations of the relevant resources on the EVSE server. The PEV performs the J3072  
298 Information Exchange needed to obtain authorization to discharge.

299 The EVSE evaluates the information exchange to see if the PEV satisfies all conditions needed  
300 for authorization to discharge. The EVSE grants or denies authorization.

301 This sequence of operations, triggered by the initial connection of the PEV to the EVSE, occurs  
302 once. If the EVSE denies authorization to the PEV, the PEV does not retry the authorization  
303 sequence. Instead, the PEV operates in its “Non-SAE J3072” mode of operation as it continues  
304 to monitor the authorization to discharge signal in case its authorization status changes.

305 The PEV then enters periodic operations where it continuously monitors its authorization to  
306 discharge. If the PEV is authorized to discharge, it sends metrology and status information the  
307 EVSE server. If the PEV is not authorized to discharge, it sends the “not authorized” status to  
308 the EVSE and can send metrology and other status information, but it is not obligated to do so.

309 Periodic operations continue for the duration of the charging session.

#### 310 **3.4.1 Service Discovery**

311 When the PEV plugs into the EVSE, the PLC on the control pilot creates a network connection  
312 for IPv6 communications between the PEV and the EVSE. IPv6 Stateless Address  
313 Autoconfiguration (SLAAC) is used to establish unique-local addresses (ULA). The EVSE  
314 creates an IPv6 prefix and advertises this prefix using IPv6 Router Advertisements (RA). The  
315 PEV client uses Router Solicitation (RS) messages to request RA's and uses the prefix in the  
316 RA to generate its own ULA.

317 For service discovery, the EVSE server implements an IPv6 mDNS responder and the PEV  
318 client discovers the EVSE server using IPv6 mDNS as defined in the IEEE 2030.5 standard.

#### 319 **3.4.2 TLS Session Establishment**

320 After determining the EVSE server address and resource locations using mDNS, the PEV client  
321 makes a TLS connection to the EVSE server. Both the EVSE server and the PEV client have a  
322 valid IEEE 2030.5 compliant certificate that is exchanged and mutually authenticated as part of  
323 the TLS handshake.

#### 324 **3.4.3 Resource Discovery**

325 After establishing a TLS connection, the PEV client obtains resource information located on the  
326 EVSE server. Resource discovery starts with the *DeviceCapability* resource, whose location  
327 was provided by mDNS. The client uses the *DeviceCapability* resource to discover other  
328 resources located on the EVSE server.

- 329    **3.4.3.1 *SelfDevice***
- 330    *DeviceCapability* provides a link to the EVSE *SelfDevice* resource. This resource is used by the  
331    EVSE server to convey site limits to the PEV. The relevant site limits are defined in SAE J3072  
332    Table 2.
- 333    **3.4.3.2 *EndDevice***
- 334    *DeviceCapability* provides a link to the *EndDevice* resource. The PEV client traverses the  
335    *EndDevice* resource to find information specifically assigned to it. Resources found in  
336    *EndDevice* include:
- 337       • *FunctionSetAssignments* (FSA) where the PEV client can be directed to specific  
338       *DERPrograms* it must follow. These *DERPrograms* can contain the site's SAE J3072  
339       Management Information (i.e., IEEE 1547 *DERCurves* and *DERControls*).  
340       • DER information links where the PEV client can send its nameplate ratings, settings, and  
341       status. The EVSE uses the settings reported by the PEV to verify it is compatible with  
342       the site limits.  
343       • *DeviceInformation* link where the PEV client can send its identity and other information  
344       • *LogEvent* link where the PEV client can send any alarm messages. This link is optional  
345       in this profile.  
346       • *PEVInfo* link where the PEV can send PEV related information. The PEV's Inverter  
347       System Model (ISM) number is sent to the EVSE server via this link. The EVSE server  
348       can verify the PEV's ISM is on the list of approved models.
- 349    **3.4.3.3 *Mirror Usage Point***
- 350    *DeviceCapability* provides a link to the *MirrorUsagePoint* resource. The PEV client uses this  
351    resource to create a mirror usage point where it can send metrology information to the EVSE  
352    server. The EVSE server can use this information to help determine if the PEV is staying within  
353    its assigned limits.
- 354    **3.4.3.4 *Log Event List***
- 355    *DeviceCapability* provides a link to the *LogEventList* resource. The PEV client uses this  
356    resource to send alarm messages to the EVSE server. Log Event support is not required in this  
357    profile.
- 358    **3.4.3.5 *Time***
- 359    *DeviceCapability* provides a link to the *Time* resource. The PEV client uses this resource to  
360    obtain system time for event timing and timestamping messages. Note the EVSE can also  
361    provide a *Time* link within an FSA. In this case, the FSA *Time* link is used for the *DERProgram*  
362    timing.
- 363    **3.4.4 *Information Exchange to Obtain Authorization to Discharge***
- 364    After the PEV has obtained the site limits and management information that are applicable to  
365    this site, and the EVSE has verified the information reported by the PEV is within the site limits,  
366    and the EVSE has optionally verified the PEV ISM is on the approved list, the EVSE grants the  
367    PEV authorization to discharge. Note that authorizing the PEV to discharge does not mean the  
368    PEV immediately starts discharging. The PEV may be commanded to start and stop discharging  
369    by a process outside the scope of SAE J3072.

370 The resource that is used to signal authorization to discharge is the *opModEnergize* object. This  
371 object maps to the IEEE 1547 Permit Service parameter.

372 If a PEV fails to get the authorization to discharge for any reason, it operates in its “Non-SAE  
373 J3072” mode of operation as it continues to monitor the *opModEnergize* object to see if will  
374 eventually get authorized.

375 While it does not have authorization to discharge, the PEV may choose to perform periodic  
376 metrology and status reporting described in section 4.7.2 but it has no obligation to do so.  
377 However, the PEV continues to send the heartbeat message for loss of communications  
378 detection described in section 4.8.1.1 regardless of its authorization to discharge status.

### 379 **3.4.5 Periodic Operations**

380 Periodic operations consist of the required SAE J3072 EV and EVSE functionality necessary to  
381 support operations after the PEV(s) has been authorized to discharge and prior to the end of the  
382 authorized discharge session. This includes ensuring the PEV remains compliant with the site  
383 settings and discharge authorizations, PEV management, and PEV monitoring.

#### 384 **3.4.5.1 PEV Compliance**

385 For compliance, SAE J3072 requires the EVSE to be able to detect when the PEV is  
386 discharging incorrectly. To accomplish this, it is assumed the EVSE has metering hardware that  
387 can measure the output of the PEV. The EVSE may also rely in part on the metrology reported  
388 by the PEV for this determination. If the PEV is detected to be discharging outside the limits  
389 provided during the authorization to discharge process, the EVSE will remove authorization to  
390 discharge within 1 second. PEVs will also support per-second monitoring of its authorization to  
391 discharge. If the PEV detects authorization to discharge has been removed, the PEV will cease  
392 to discharge within a specified time limit. If the PEV continues to discharge when authorization  
393 to discharge has not been granted or has been removed, the EVSE will physically disconnect  
394 the PEV from the site.

#### 395 **3.4.5.2 PEV Management**

396 IEEE 2030.5 supports two types of controls: *DERControls* and *DefaultDERControls*. A  
397 *DERControl* includes a start time, duration, and control-related parameters. Responses to  
398 *DERControls* (event status) may be required to be provided. *DefaultDERControls* are a type of  
399 control that is meant to be active if no *DERControl* is active. *DefaultDERControls* do not include  
400 start time and durations, nor are responses provided. The EVSE and the PEV will support both  
401 types of controls

402 During the discharging session, the EVSE may be sent a control from an external DER  
403 Managing Entity (DME). The EVSE will relay this control and related event parameters to the  
404 connected and approved PEV when it is received. If no PEV is connected and approved to  
405 discharge, the EVSE may store DER control events. The EVSE and PEV are required to  
406 support all control-related capabilities as defined in SAE J3072 sections 4.6.6, 4.7.2, and 4.7.4.

#### 407 **3.4.5.3 PEV Monitoring**

408 Per SAE J3072, the PEV will periodically provide monitoring and PEV information to the EVSE.  
409 Monitoring information consists of measurements, status and other information that can be used  
410 to manage the PEV charging and discharging. The PEV and EVSE are required to support the  
411 monitoring information in SAE J3072 sections 4.7.3 and 4.7.4.

412 The PEV is required to be able to post this information as fast as one second, but in practice,  
413 the frequency of posting this information may be much lower. The EVSE server will use the

414    *postRate* attributes found the PEV's *EndDevice* and *MirrorUsagePoint* resource to indicate the  
415    required posting rates. The PEV will periodically poll these resources to obtain the required  
416    rates. The EVSE should also make these *postRates* configurable.

## 417    **3.5 Other Functions**

### 418    **3.5.1 Exception Handling**

419    The PEV operates in its "Non-SAE J3072" mode of operation unless it has been granted the  
420    authorization to discharge by the EVSE. The authorization to discharge could be removed  
421    explicitly by the EVSE by setting the *DefaultDERControl:opModEnergize* resource to false.  
422    When the PEV detects the authorization to discharge has been removed, the PEV will cease to  
423    discharge within a specified time limit.

424    The authorization to discharge is implicitly removed upon loss of communications with the EVSE  
425    or any other exception encountered by the PEV.

426    The PEV can force a restart of the SAE J3072 authorization process by a TBD method.

427    The EVSE monitors the PEV to verify the PEV is discharging within its authorized limits. The  
428    EVSE should withhold the authorization to discharge if it encounters any exception with the  
429    PEV. If the EVSE decides to withhold authorization, the EVSE should allow the PEV to operate  
430    in its preferred charging mode. The EVSE should only open the contactor if the PEV is  
431    discharging when it has not been authorized or if it is discharging outside its authorized limits.

432    The EVSE can force a restart of the SAE J3072 authorization process by a TBD method.

### 433    **3.5.2 Coordinated Charging/Discharging**

434    SAE J3072 requires the implementation of SAE J2836/3 Use Case U6 "Coordinated  
435    Charge/Discharge Management Function".

### 436    **3.5.3 PEV Sleep/Wake Functions**

437    For some scenarios, the PEV may go into a long-term sleep mode and then wakes up to  
438    resume normal operations. SAE J3072 does address this use case. Until SAE J3072 addresses  
439    this issue in a future revision, this profile recommends treating sleep mode as if the PEV has  
440    disconnected and the wake mode as if the PEV has re-connected.

## 4 Profile Normative Requirements

This section contains all the normative requirements of this profile. The following conventions are used.

- Mandatory: MUST, MUST NOT, SHALL, SHALL NOT
- Recommended: RECOMMENDED, SHOULD, SHOULD NOT
- Optional: MAY

Note: SAE J3072 requires compliance to IEEE 1547-2018 and IEEE 1547.1-2020. This profile indirectly references those documents as they are device and interconnection standards, whereas this profile is a communications protocol standard. However, it is helpful for the reader to be aware that much of the PEV/EVSE interactions originate from IEEE 1547 requirements.

### 4.1 IEEE 2030.5 Requirements

All devices SHALL comply with the IEEE 2030.5-2018 or later standard unless otherwise noted. If the standard is referenced without a date (e.g., IEEE 2030.5), the applicable version is IEEE 2030.5-2018.

#### 4.1.1 Function Sets

As a profile of the IEEE 2030.5 standard, this section defines the IEEE 2030.5 function sets that are required to be implemented to support this profile. The EVSE MUST operate as an IEEE 2030.5 Server. The EVSE MAY operate as an IEEE 2030.5 Client, but this functionality is beyond the scope of this profile. The PEV MUST operate as an IEEE 2030.5 Client. The PEV MAY operate as an IEEE 2030.5 Server, but this functionality is beyond the scope of this profile. The following table shows the function sets that MUST be implemented for this profile. Other function sets MAY be implemented.

463

Function Set	EVSE (IEEE 2030.5 Server)	PEV (IEEE 2030.5 Client)
<i>DeviceCapability</i>	MUST	MUST
<i>Time</i>	MUST	MUST
<i>SelfDevice:DER</i>	MUST	MUST
<i>EndDevice:DeviceInformation</i>	MUST	MUST
<i>EndDevice:PowerStatus:PEVInfo</i>	MUST	MUST
<i>EndDevice:DER</i>	MUST	MUST
<i>EndDevice:FunctionSetAssignment</i>	MUST	MUST
<i>MirrorUsagePoint</i>	MUST	MUST
<i>DER (Programs)</i>	MUST	MUST
<i>Response</i>	MUST	MUST
<i>Subscription/Notification</i>	MUST	MAY

464

Table 2 – Profile Function Sets

465 **4.1.2 Session-Static Resources**

466 IEEE 2030.5 clients do not assume that URIs for resources are fixed on all servers or even on a  
 467 given server (over time), but rather retrieve the appropriate URIs through resource discovery  
 468 and links within resources. However, the IEEE 2030.5 standard does make the following  
 469 allowance.

470 *For network efficiency, devices MAY assume URIs are fixed on a particular server over time.*

471 This profile uses this allowance to improve efficiency and simplify implementations by making  
 472 certain Server resources static for the duration of the connect session. The table below shows  
 473 which resources the EVSE server MUST remain static for the duration of the charge session.

474

Function Set	Resource
<i>DeviceCapability</i>	<i>DeviceCapability</i> and all top-level links
<i>SelfDevice</i>	<i>SelfDeviceLink</i> , all top-level links under <i>SelfDevice</i> , and all links under <i>SelfDevice:DERList:DER</i>
<i>EndDevice</i>	<i>EndDeviceListLink</i> , all top-level links under <i>EndDevice</i> , and all links under <i>EndDevice:DERList:DER</i>
<i>MirrorUsagePoint</i>	<i>MirrorUsagePointList</i> and <i>MirrorUsagePoint</i> in the Location Header

475

Table 3 – Session-Static Resources

- 476 **4.1.3 Security**
- 477 This profile supports all the security and certificate requirements of IEEE 2030.5 unless  
 478 otherwise noted. The EVSE Server and the PEV Client MUST have an IEEE 2030.5 compliant  
 479 certificate. All communications in this profile MUST use HTTPS. HTTP MUST NOT be used.
- 480 **4.1.3.1 Additional Security Considerations**
- 481 The only known vulnerability to the communications link between the EVSE and the PEV is a  
 482 Man-In-the-Middle threat.
- 483 **4.1.3.1.1 MITM Threat**
- 484 The interface between the EVSE and the PEV defined in this document is subject to Man-In-the-  
 485 Middle (MITM) attacks. In theory, an attacker can set up an illegitimate server on the PLC link  
 486 and try to convince the PEV to talk to it instead of the EVSE server. In practice, this is probably  
 487 difficult to do because of the point-to-point physical connection, and the SLAC protocol is used  
 488 for the PEV to establish the PLC link to the correct EVSE. Also, an attacker must have a copy of  
 489 a legitimate private key and certificate chained back to a valid Certificate Authority for this attack  
 490 to work. However, even though this spoofing is difficult, it is not impossible; the risk of an MITM  
 491 attack is low, and the risks of a successful attack are acceptable. Therefore, this profile does not  
 492 attempt to mitigate this MITM risk.
- 493 **4.1.3.1.2 MITM Mitigation Considerations**
- 494 This profile considered the use of the IEEE 2030.5 Registration PIN for the PEV to authenticate  
 495 the EVSE server to mitigate the MITM threat. This mitigation technique requires both the EVSE  
 496 and the PEV to support Registration, and it requires additional user interactions that degrade  
 497 the user experience.
- 498 Weighing the benefits of this MITM protection versus the added burden to the user, this profile  
 499 chose not to implement this mitigation technique.
- 500 **4.1.4 Subscription and Notification**
- 501 This profile requires certain Server resources MUST be subscribable to improve efficiency. The  
 502 following table lists the resources the Server MUST make subscribable.
- 503
- | Resource                                |
|---|
| <i>DER:DERProgram:DERControlList</i>    |
| <i>DER:DERProgram:DefaultDERControl</i> |
| <i>FunctionSetAssignmentsList</i>       |
| <i>DER:DERProgramList</i>               |
- 504 Table 4 – Subscribable Resources
- 505 The PEV client SHOULD use Subscription/Notification to improve network efficiency. If  
 506 Subscription/Notification fails for the PEV or if the PEV chooses not to use subscriptions, the  
 507 PEV MUST poll these resources at the *pollRate* specified by the EVSE server. For these  
 508 subscribable resources, the EVSE server MUST be capable of setting the *pollRate* as fast as 1  
 509 second and the PEV client MUST be capable of polling at a *pollRate* as fast as every 1 second.

510 In addition, the EVSE SHALL set the *DERProgramList:pollRate* to 1 second and this *pollRate*  
511 SHALL NOT be changeable.

## 512 **4.2 Networking**

513 The scope of this networking section is the link between the EVSE and the PEV.

### 514 **4.2.1 Physical Layer**

515 SAE J3072 System Type A1 (AC Level 2 Charging) uses power-line communications (PLC)  
516 over the SAE J1772 control pilot as a point-to-point physical connection between the EVSE and  
517 the PEV as specified in Appendix G.3 of the SAE J3072 standard.

### 518 **4.2.2 MAC Layer**

519 The PLC connection provides an IEEE 802.3 ethernet link between the EVSE and the PEV.

### 520 **4.2.3 IP Layer**

521 IPv6 SHALL be used for all SAE J3072 communications between the EVSE and the PEV. IPv4  
522 is not supported.

523 IPv6 unique local addresses (ULA) in the address block `fd00::/8` SHALL be used. The PEV  
524 SHALL use SLAAC (stateless address autoconfiguration) to obtain the unique local address for  
525 SAE J3072 EVSE communications. The EVSE SHALL advertise the ULA network prefix via  
526 Router Advertisement (RA) messages using a Router Advertisement daemon or equivalent.

527 The IPv6 link-local address of `ff02::fb` SHALL be used for mDNS service discovery.

### 528 **4.2.4 Bridging, Routing, and Multi-Server Support**

529 On the initial PEV connection, the EVSE SHALL prohibit bridging and/or routing of the PEV  
530 communications. Therefore, the EVSE SAE J3072 (IEEE 2030.5) server is the only server  
531 visible to the PEV on initial connection.

532 Once the EVSE has successfully authorized the PEV to discharge, the EVSE MAY optionally  
533 enable bridging and/or routing of non-SAE J3072 PEV communications. The enabling of  
534 bridging and/or routing can expose the PEV to other servers providing other services. The  
535 interactions of the PEV with other servers is outside the scope of this profile.

536 For an SAE J3072 compliant PEV that has failed to get authorization to discharge, an SAE  
537 J3072 compliant EVSE MAY choose to bridge and/or route non-SAE J3072 communications but  
538 has no obligation to do so. However, the EVSE MUST continue the SAE J3072 communications  
539 between the PEV and EVSE.

540 Bridging and/or routing of a Non-SAE J3072 compliant PEV's communications is outside the  
541 scope of this profile. An SAE J3072 compliant EVSE MAY choose to bridge and/or route its  
542 communications but has no obligation to do so.

### 543 **4.2.5 TCP, UDP, and Upper Layers**

544 This profile does not make any changes to these layers.

545 **4.3 Service Discovery**

546 Multicast DNS (mDNS) defined in IETF RFC 6762 SHALL be used to perform DNS-like queries  
547 on the local link between the EV and the EVSE. The mDNS reserves “.local” domain to name  
548 services that have link-local scope and uses link-local multicast addressing for requests and  
549 either multicast or unicast addressing for responses. IPv6 address SHALL be supported by the  
550 mDNS mechanism. For backward compatibility, extended multicast xmDNS SHOULD be used  
551 to support devices that have implemented the xmDNS services. Optionally, client devices  
552 SHOULD support out of band discovery as a fallback when mDNS or xmDNS services are not  
553 available. Unicast DNS where a DNS name server is used SHALL NOT be required.

554 The mDNS Service Instance Name for this profile SHALL have the following format:

555 device-000001111114.\_smartenergy.\_tcp.local

556 where `device-000001111114` is the <Instance> portion, `smartenergy` is the Service Name,  
557 `tcp` is the transport protocol, and `local` is the <Domain> portion.

558 **4.3.1 Subtype Query**

559 Subtype query where the client devices can discover other 2030.5 resources beyond  
560 DeviceCapability MAY be implemented by the 2030.5 server and client following the IEEE  
561 2030.5 Subtype query feature. These resources MAY be discoverable by the client using mDNS  
562 subtype query: *EndDevice* (“edev” subtype name), *SelfDevice* (“sdev” subtype name),  
563 *MirrorUsagePointList* (“mup” subtype name).

564 **4.4 Security**

565 The EVSE and the PEV in this profile complies with all the IEEE 2030.5 security requirements.

566 The device certificate for the PEV SHALL comply with the IEEE 2030.5 Device certificate as  
567 defined in IEEE 2030.5 with the clarifications in this section. The PEV make and model SHALL  
568 be encoded in the *HardwareModuleName* object. As specified in IEEE 2030.5, the *hwType* field  
569 of the *HardwareModuleName* is an Object ID (OID) assigned from the PEV manufacturer’s own  
570 base OID arc according to its own policies. The manufacturer’s base OID identifies the make of  
571 the PEV. Within the manufacturer’s OID domain, a unique OID is assigned to each vehicle  
572 model. Therefore, the *hwType* field encodes both the make and model of the PEV. The PEV  
573 manufacturer SHALL assign a unique *hwType* OID for each of its PEV models.

574 **4.5 Resource Discovery**

575 This section describes the resources required to support SAE J3072 interactions between the  
576 EVSE and the PEV.

577 **4.5.1 Device Capability**

578 The EVSE and PEV MUST support the *DeviceCapability* function set. The PEV SHALL discover  
579 the location of the EVSE Server’s *DeviceCapability* resource using mDNS.

580 The EVSE SHALL populate the following links in the *DeviceCapability* resource:

- 581 • *EndDeviceListLink*
- 582 • *SelfDeviceLink*
- 583 • *TimeLink*
- 584 • *MirrorUsagePointListLink*

585 The EVSE SHALL NOT populate *DeviceCapability* with a *DERProgramListLink*. Normally, IEEE  
586 2030.5 uses this resource for public *DERPrograms*. For this profile, public *DERPrograms* are  
587 not supported. Instead, the PEV locates its *DERPrograms* using the  
588 *FunctionSetAssignmentListLink* contained in the PEV's *EndDevice* instance.

589 The PEV SHALL get the *DeviceCapability* resource from the EVSE Server.

#### 590 **4.5.2 TLS Session Establishment and Authentication**

591 When the PEV makes a connection to the EVSE to get the *DeviceCapability* resource, a TLS  
592 connection is negotiated between the TLS client (PEV) and the TLS server (EVSE). During the  
593 TLS handshake, the EVSE and PEV mutually exchange their IEEE 2030.5 device certificates.  
594 At this point, the EVSE knows the identity of the PEV and can calculate the PEV's LFDI/SFID  
595 from its certificate. The EVSE MAY use the PEV's LFDI/SFID for authentication against an  
596 Allow List. How the EVSE is provisioned with this Allow List is beyond the scope of this profile.  
597 The EVSE MAY use the PEV make/model information encoded in the PEV certificate's  
598 *HardwareModuleName* object as an additional authorization criterion.

599 If the EVSE chooses not to authenticate the PEV, the EVSE SHALL terminate the TLS session.  
600 If the EVSE detects a TLS handshake failure, EVSE SHALL terminate the TLS session. If the  
601 PEV detects a TLS handshake failure, the PEV SHALL terminate the TLS session. If the PEV  
602 detects or generates a terminated TLS session, the PEV SHALL revert to its "Non-SAE J3072"  
603 mode of operation.

#### 604 **4.5.3 EndDevice**

605 The EVSE and PEV MUST support the *EndDevice* function set. The EVSE SHALL populate the  
606 *EndDeviceList* with an *EndDevice* instance representing the connected PEV.

607 The PEV SHALL get its *EndDevice* instance from the EVSE Server. This can be done in two  
608 ways. The EVSE Server MAY support mDNS *EndDevice* subtype queries. Alternately, the PEV  
609 can discover the location of its *EndDevice* instance by walking the *EndDeviceList* whose  
610 location is specified in *DeviceCapability*. If the PEV fails to locate its *EndDevice* instance, the  
611 PEV SHALL consider the SAE J3072 authorization failed and revert to its "Non-SAE J3072"  
612 mode of operation.

613 After finding the location of its *EndDevice* instance, the PEV SHALL get its *EndDevice* instance.

614 The EVSE SHALL populate the *EndDevice* instance with the following resources:

- 615     • *DeviceInformationLink*
- 616     • *PowerStatusLink*
  - 617         ◦ *PowerStatus:PEVInfo*
- 618     • *SubscriptionListLink*
- 619     • *DERListLink*
  - 620         ◦ *DER:DERCapabilityLink*
  - 621         ◦ *DER:DERSettingsLink*
  - 622         ◦ *DER:DERAvailabilityLink*
  - 623         ◦ *DER:DERStatus*
- 624     • *FunctionSetAssignmentsListLink*

625 The EVSE SHALL NOT populate the *EndDevice* instance with the *RegistrationLink* resource.  
626 The *Registration* resource is normally used by an IEEE 2030.5 client to verify it is connected to

627 the correct server. For the SAE J3072 use case, the only sever visible to the PEV client upon  
628 connection is the EVSE SAE J3072 server, so the *Registration* resource is not needed.

629 The EVSE MAY populate the *EndDevice* instance with other resources.

#### 630 **4.5.3.1 DeviceInformationLink**

631 The PEV SHALL populate the *DeviceInformationLink* with information specified in SAE J3072  
632 Table C4 unless otherwise noted here.

633 Although SAE J3072 Table C4 marks the following objects as “R” (required by IEEE 2030.5),  
634 they are not actually required by IEEE 2030.5. The PEV SHALL NOT be required to populate  
635 *DeviceInformation* with the following resources:

- 636     • *functionsImplemented*
- 637     • *gpsLocation*
- 638     • *pollRate*

#### 639 **4.5.3.2 PowerStatusLink**

640 The PEV SHALL populate the *PowerStatus:PEVInfo* with information specified in SAE J3072  
641 Table C9.

#### 642 **4.5.3.3 SubscriptionListLink**

643 The EVSE MUST make the resources in Table 4 subscribable. The PEV MAY use the  
644 *SubscriptionListLink* to subscribe to any of the subscribable resources in Table 4.

#### 645 **4.5.3.4 DERListLink**

646 The EVSE SHALL populate the *DERListLink* with a *DER* instance containing links to  
647 *DERCapability*, *DERSettings*, *DERAvailability*, and *DERStatus*. Typically, a single a *DER*  
648 instance is all that is needed to implement this profile.

649 The PEV SHALL populate the *DERCapability* with information specified in SAE J3072 Table C5.

650 The PEV SHALL populate the *DERSettings* with information specified in SAE J3072 Table C3.

651 The PEV SHALL populate the *DERAvailability* with information specified in SAE J3072 Table  
652 C9.

653 The PEV SHALL use *DERStatus* to send heartbeat messages to the EVSE as described in  
654 section 4.8.1.1. The PEV SHALL use *DERStatus:inverterStatus* to report status information  
655 required in section 4.7.2 and section 4.8.3.

#### 656 **4.5.3.5 FunctionSetAssignmentsListLink**

657 The EVSE SHALL populate the *FunctionSetAssignmentsList* with a *FunctionSetAssignments*  
658 instance. Typically, a single a *FunctionSetAssignments* instance is all that is needed to  
659 implement this profile.

660 The *FunctionSetAssignments* instance SHALL contain a *TimeLink*. The PEV SHALL use the  
661 *TimeLink* to obtain the EVSE Server time.

662 The *FunctionSetAssignments* instance SHALL contain a *DERProgramListLink*. The  
663 *DERProgramListLink* SHALL contain a *DERProgram*. Typically, a single a *DERProgram* is all  
664 that is needed to implement this profile.

665 The *DERProgram* SHALL contain a *DefaultDERControlLink*. The EVSE SHALL populate the  
666 *DefaultDERControl* with the *opModEnergize* object which is used to grant or deny authorization  
667 to discharge.  
668 If the site settings use the Enter Service function, the EVSE SHALL populate the  
669 *DefaultDERControl* with information specified in SAE J3072 Table C7 with values applicable to  
670 the local jurisdiction.  
671 The *DERProgram* SHALL contain a *DERControlListLink*. The EVSE SHALL populate the  
672 *DERControlList* with all the SAE J3072 management information (i.e., DER curves and controls)  
673 in effect for this site.  
674 The PEV SHALL obtain the *FunctionSetAssignmentsList*, *DERProgramList*, *DERProgram*,  
675 *DefaultDERControl*, and the *DERControlList* and its contents.

## 676 **4.6 Initial Information Exchange**

677 Resource discovery is complete once the PEV has discovered the locations of all the relevant  
678 resources on the EVSE. Before the EVSE authorizes the PEV to discharge, the PEV exchanges  
679 information with the EVSE. The Information Exchange consists of three steps:

- 680     1. The PEV gets site limit parameters from the EVSE  
681     2. The PEV sends configuration information to the EVSE  
682     3. The PEV gets and applies management information from EVSE

683 Step 1 MUST occur before step 2 as the site limits from step 1 affects the configuration  
684 information reported in step 2. After the PEV performs all three steps, the PEV goes into  
685 Periodic Operations and monitors the EVSE for authorization to discharge.

686 After the PEV completes the three steps, the EVSE MAY authorize the PEV to discharge if the  
687 PEV meets all the discharge requirements.

### 688 **4.6.1 Step 1: PEV Gets the Site Limits**

689 The PEV gets the sites limits from the EVSE's *SelfDevice:DER:DERSettings* resource. The  
690 contents of this resource on the EVSE represents the site limits the PEV adheres to when  
691 authorized to discharge at this site. SAE J3072 Table 2 lists the site limit values provided by the  
692 EVSE, and SAE J3072 Table C3 maps these limits to the appropriate  
693 *SelfDevice:DER:DERSettings* resource.

694 The EVSE MUST provide all the *SelfDevice:DER:DERSettings* resources listed in SAE J3072  
695 Table C2.

696 The PEV MUST get all the EVSE's *SelfDevice:DER:DERSettings* resources listed in SAE J3072  
697 Table C2.

#### 698 **4.6.1.1 Active Power Limit**

699 The EVSE SHALL use its *SelfDevice:DER:DERSettings:WMax* resource to convey the Active  
700 Power limit to the PEV. The Active Power limit (WMax) is used instead of the Apparent Power  
701 limit (VAMax) to be compatible with IEEE 1547. IEEE 1547 also defines the priority of Active  
702 and Reactive power. The EVSE MAY use the *DERControl:opModMaxLimW* to further limit the  
703 PEV maximum active power where there are additional constraints that require lowering the limit  
704 from the default value of 100%. Note that the 100% reference point equals the PEV's Active  
705 Power limit reported in the PEV's *EndDevice:DER:DERSettings:WMax* setting. If

706    *opModMaxLimW* is used to change the active power limit, this does not change the *%setMaxW*  
707    reference point for any curve or control that uses *%setMaxW* as the reference type.

708    One example of an additional constraint is the multi-port EVSE use case. When the first PEV  
709    plugs into a multi-port EVSE, the first PEV gets the site limits from the EVSE's  
710    *SelfDevice:DER:DERSettings* resource. When a second PEV plugs in, the EVSE may need to  
711    further limit the maximum active power limit of the first PEV. It can do so using the  
712    *DERControl:opModMaxLimW* control targeted to the first PEV.

713    Note: Defined by their J3072 System Type, signals for the supply equipment electrical limits are  
714    supplied outside of the communication defined in this profile. For example, when operating  
715    under System Type A1 this is provided by the PWM in amperes. These limits must be respected  
716    during operation.

#### 717    **4.6.2 Step 2: PEV Sends Configuration Information to the EVSE**

718    After obtaining the site limits from the EVSE, the PEV provides configuration information to the  
719    EVSE. The PEV sends this information to the EVSE by a PUT or POST of resources to the  
720    appropriate link provided by the *EndDevice* instance. The required configuration information is  
721    listed in SAE J3072 Table 3. The contents of this table map to various resources in the IEEE  
722    2030.5 *DERSettings*, *DeviceInformation*, and *DERCapability* objects.

##### 723    **4.6.2.1 IEEE 2030.5 DERSettings Object**

724    SAE J3072 uses the *DERSettings* object for the PEV to report its site-adjusted settings to the  
725    EVSE.

726    The PEV MUST send all the J3072 marked resources listed in SAE J3072 Table C3 to the  
727    EVSE's *EndDevice:DER:DERSettings* link.

728    The PEV SHALL include the *setMaxWh* resource as part of its *DERSettings*. The *setMaxWh*  
729    resource is currently not a requirement in SAE J3072, but it is needed as the reference for the  
730    PEV state of charge percentage. Future revisions of SAE J3072 will probably mandate this  
731    resource.

##### 732    **4.6.2.2 IEEE 2030.5 DeviceInformation Object**

733    SAE J3072 uses the *DeviceInformation* object to convey SAE J3072 specific information. This  
734    information includes the SAE J3072 Certification Status, the Certification Date, the vehicle VIN,  
735    the Inverter System Model Number, and other information. This information helps the EVSE to  
736    determine whether the PEV is eligible for authorization to discharge.

737    Note: How the EVSE obtains the database of approved ISM numbers is outside the scope of  
738    this profile.

739    The PEV MUST send all the resources listed in SAE J3072 Table C4 to the EVSE's  
740    *EndDevice:DeviceInformation* link.

##### 741    **4.6.2.3 IEEE 2030.5 DERCapability Object**

742    SAE J3072 uses the *DERCapability* object for the PEV to send some general nameplate  
743    information to the EVSE. These nameplate resources are listed in SAE J3072 Table C5.

744    The PEV MUST send all the SAE J3072 marked resources listed in SAE J3072 Table C5 to the  
745    EVSE's *EndDevice:DER:DERCapability* link.

- 746   **4.6.2.4 IEEE 2030.5 DERAvailability Object**
- 747   SAE J3072 uses the *DERAvailability* object for the PEV to send storage related information to  
748   the EVSE for the coordinated charge/discharge use case. These resources are listed in SAE  
749   J3072 Table C9.
- 750   The PEV MUST send all the resources listed in SAE J3072 Table C9 to the EVSE's  
751   *EndDevice:DER:DERAvailability* link.
- 752   **4.6.2.5 IEEE 2030.5 PEVInfo Object**
- 753   SAE J3072 uses the *PEVInfo* object for the PEV to send storage related information to the  
754   EVSE for the coordinated charge/discharge use case. These resources are listed in SAE J3072  
755   Table C9.
- 756   The PEV MUST send all the resources listed in SAE J3072 Table C9 to the EVSE's  
757   *EndDevice:PowerStatus:PEVInfo* link.
- 758   **4.6.3 Step 3: PEV Gets Management Information from the EVSE**
- 759   As a condition for authorization to discharge, the PEV gets and applies Management  
760   Information from the EVSE. Management Information consists of the DER curves and controls  
761   that are in effect for the site. SAE J3072 provides a list of the Management Information functions  
762   in SAE J3072 Table 14.
- 763   SAE J3072 requires the PEV to configure itself to the IEEE 1547 Management Information  
764   default values at the time it connects to the EVSE. SAE J3072 allows the EVSE to assume the  
765   PEV is operating with the IEEE 1547 default settings such that the EVSE only needs to send the  
766   PEV Management Information that is different from the IEEE 1547 defaults.
- 767   Although SAE J3072 allows the EVSE to assume the PEV is operating with IEEE 1547 defaults  
768   upon connection, this profile mandates the EVSE SHALL provide **ALL** Management Information  
769   listed in SAE J3072 section 4.6.6.11 that are in effect for the site upon connection. Some  
770   Management Information controls in section SAE J3072 section 4.6.6.11 are mutually exclusive.  
771   For example, the Constant Power Factor and Constant Reactive Power controls cannot both be  
772   simultaneously active. The EVSE MUST ensure that all the Management Information that are in  
773   effect for the site are mutually compatible.
- 774   When providing Management Information, the EVSE MUST exclusively use the *DERControl* or  
775   the *DefaultDERControl* version of the function as specified in Table 5, Column 4 below.
- 776   This profile requires responses for all *DERControls*. The EVSE MUST set the  
777   *responseRequired* attribute bit 0 (message received) and bit 1 (event response). The EVSE  
778   SHALL set the start time of each Management Information *DERControl* to the current time. The  
779   EVSE SHALL set the duration of each Management Information *DERControl* to the maximum  
780   allowed value of 4294967295 (0xffffffff) seconds.
- 781   This profile requires separate responses for each *DERControl*. Therefore, the EVSE SHALL  
782   only create *DERControls* containing a single IEEE 2030.5 *opMod...* function. For each  
783   *DERControl*, the EVSE SHALL set bit 0 and bit 1 of the control's *responseRequired* field.
- 784   The PEV SHALL get all *DERControls* provided by the EVSE.
- 785   Note: For this profile, the PEV sends the Event Started Response prior to being authorized to  
786   discharge by the EVSE.
- 787   In a typical connect session, the Management Information DER controls do not change for the  
788   duration of the connect session. However, there can be cases where the EVSE needs to

789 change the Management Information during a connect session. In this case, the EVSE MAY  
790 create a new *DERControl* with a more recent start time such that the new *DERControl*  
791 supersedes the existing *DERControl*. It is expected that the PEV transitions from the  
792 superseded *DERControl* to the superseding *DERControl* without disrupting ongoing operations.

#### 793 **4.6.4 Authorization to Discharge**

794 After completing the three steps above, the EVSE can determine if the PEV is authorized to  
795 discharge. At a minimum, the EVSE MUST verify the following:

- 796     • The PEV is Certified
- 797     • The PEV's status as a 2-quadrant or 4-quadrant inverter matches the site setting
- 798     • The PEV's ISM number is in the approved database
- 799     • The PEV's reported configuration information complies with the site limits
- 800     • The PEV has provided all the Event Received and Event Started Responses for all the
- 801         Management Information provided by the EVSE.

802 The EVSE MAY use the PEV make/model information encoded in the PEV certificate's  
803 *HardwareModuleName* object to authenticate the PEV as an additional condition for  
804 authorization to discharge.

805 The authorization to discharge maps to the IEEE 1547 "Permit Service" parameter which maps  
806 to the IEEE 2030.5 *DefaultDERControl:opModEnergize* boolean object in this profile.

807 To indicate the PEV is authorized to discharge, the EVSE MUST set  
808 *DefaultDERControl:opModEnergize* to true. To revoke authorization to discharge for any  
809 reason, the EVSE MUST set *DefaultDERControl:opModEnergize* to false.

810 After completing the steps above, the PEV goes to periodic operations while monitoring the  
811 *DefaultDERControl:opModEnergize* object for changes to the authorization to discharge.

#### 812 **4.6.5 Enter Service**

813 Once the PEV has obtained its authorization to discharge, it MAY do so based on controls that  
814 are outside the scope of this profile. If the PEV does discharge, it does so according the Enter  
815 Service parameters it obtained in the Management Information transfer.

816 How the EVSE obtains the Enter Service parameters is outside the scope of this profile.  
817 Normally this information is provided by the utility. If the EVSE can determine if the grid voltage  
818 and frequency are already at acceptable values, the EVSE MAY reduce the Enter Service Delay  
819 presented to the PEV in the Management Information transfer to improve response times.

### 820 **4.7 Periodic Operations**

#### 821 **4.7.1 PEV Control**

822 The following requirements SHALL apply once the PEV has received its permission to  
823 discharge (*opModEnergize*). If the PEV has not received permission to discharge, it MUST  
824 continue to monitor the EVSE Server's *opModEnergize* via polling or subscription while it is  
825 connected to the EVSE.

826 *DERControls* SHALL conform to IEEE 2030.5 section 10.2.3 event rules.

827 The EVSE server and PEV client SHALL support the Management Information functions in  
828 Table 5.

829 The EVSE SHALL be the only server for the Management Information controls in Table 5. The  
830 PEV MUST NOT accept any Management Information controls from any other server.

831 For each Management Information control, the EVSE SHALL exclusively use the DERControl  
832 Type specified in the 3<sup>rd</sup> column of Table 5. Functions marked as *DERControl* SHALL NOT be  
833 used as *DefaultDERControls*. Functions marked as *DefaultDERControls* SHALL NOT be used  
834 as *DERControls*.

835

Function	IEEE 2030.5 Control	IEEE 2030.5 DERControl Type
Constant Power Factor	<i>opModFixedPFIInjectW</i>	DERControl
Volt-Var Curve	<i>opModVoltVar</i>	DERControl
Watt-Var Curve	<i>opModWattVar</i>	DERControl
Constant Var	<i>opModFixedVar</i>	DERControl
Volt-Watt Curve	<i>opModVoltWatt</i>	DERControl
High Frequency Trip	<i>opModHFRMustTrip</i>	DERControl
Low Frequency Trip	<i>opModLFRMustTrip</i>	DERControl
Limit Active Power	<i>opModMaxLimW</i>	DERControl
Enter Service	<i>setESDelay</i> , <i>setESHighFreq</i> , <i>setESHighVolt</i> , <i>setESLowFreq</i> , <i>setESLowVolt</i> , <i>setESRampTms</i> , <i>setESRandomDelay</i>	DefaultDERControl

Low Frequency Droop	<i>opModFreqDroop</i>	DERControl
High Voltage Trip	<i>opModHVRTMomentaryCessation</i> <i>opModHVRMustTrip</i>	DERControl
Low Voltage Trip	<i>opModLVRTMomentaryCessation</i> <i>opModLVRMustTrip</i>	DERControl

836 Table 5 – Required Management Information Functions

837 **4.7.2 PEV Monitoring**

838 The PEV SHALL use *DERStatus:inverterStatus* to report its authorization to discharge status.  
839 The following enumerations SHALL be used as indicated.

- 840 • “0 – N/A” SHALL indicate the PEV is awake and authorized to discharge.  
841 • “2 – sleeping” SHALL indicate the PEV is sleeping.  
842 • “3 – starting up or ON but not producing power” SHALL indicate the PEV is awake but  
843 not authorized to discharge.

844 The PEV MUST provide the monitoring information as described in Table 6 when awake and  
845 authorized to discharge (*opModEnergize*). If the PEV is awake but not authorized to discharge,

- 846 it MAY provide the monitoring information. The PEV SHALL NOT provide monitoring information  
847 if it is sleeping.
- 848 Except for *alarmStatus*, the PEV SHALL provide the monitoring information in Table 6 based on  
849 the EVSE's *EndDevice:postRate* and the *MirrorUsagePoint:postRate*. The EVSE SHOULD  
850 provide a default value of 15 seconds for these *postRates*.
- 851 If the EVSE does not provide an *EndDevice:postRate* resource, the PEV SHALL use a *postRate*  
852 of 15 seconds.
- 853 If the EVSE does not provide a *MirrorUsagePoint:postRate* resource, the PEV SHALL use a  
854 *postRate* of 15 seconds.
- 855 Per SAE J3072, the PEV SHALL be able to provide *PEVInfo* and *DERAvailability* information as  
856 fast as one second.
- 857 The PEV SHALL poll for changes to the *EndDevice:postRate* and the  
858 *MirrorUsagePoint:postRate* resources based on the *pollRate* set by the EVSE. The  
859 EVSE SHOULD provide a default value of 15 seconds for these *pollRates*.
- 860 If the EVSE does not provide an *EndDeviceList:pollRate* resource, the PEV SHALL use a  
861 *pollRate* of 15 seconds.
- 862 If the EVSE does not provide a *MirrorUsagePointList:pollRate* resource, the PEV SHALL use a  
863 *pollRate* of 15 seconds.
- 864 All *MirrorMeterReadings*, *DERStatus*, *PEVInfo* and *DERAvailability* data SHALL include a date-  
865 time stamp.
- 866 The PEV SHALL update its *EndDevice:DER:DERStatus:alarmStatus* as alarms are set and  
867 cleared. When no alarms are present, the PEV SHALL set the *alarmStatus* accordingly.

Monitoring Information	IEEE 2030.5 Usage
Active Power (W)	ReadingType uom: 38 (watts) ReadingType phase: 128 (A) ReadingType:flowDirection: 19 (reverse) ReadingType:accumulationBehavior: 12 ReadingType:powerOfTenMultiplier

Table 6 – SAE J3072 Required Monitoring Information

870 EVSE servers SHALL support the IEEE 2030.5 *MirrorUsagePoint* for PEV metrology reporting.  
 871 PEV clients SHALL use the IEEE 2030.5 Metering Mirror function set to report metrology data.

872 The PEV SHALL create its *MirrorUsagePoint* with the following requirements:

- *deviceLFDI* SHALL be included.
- *roleFlags* SHALL set “bit 2 – isPEV”. All other bits SHALL NOT be set.
- *serviceCategoryKind* SHALL be set to “0 – electricity”.

876 The PEV SHALL create *MirrorMeterReadings* for Active Power, Reactive Power, Voltage, and  
877 Frequency with the corresponding required *ReadingType* fields shown in Table 6. The  
878 *dataQualifier* field SHALL NOT be provided. Other *ReadingType* fields MAY be provided.

879 The monitoring data SHALL use a DER reference frame. Active and Reactive power flow from  
880 the PEV to the electric grid SHALL have positive values. Active and Reactive power flow from  
881 the electric grid to the PEV SHALL have negative values.

## 882 **4.8 Other Functions**

### 883 **4.8.1 Exception Handling**

#### 884 **4.8.1.1 Loss of Communications when PEV is Connected to the EVSE**

885 The PEV SHALL send an *EndDevice:DER:DERStatus* message every 1 second irrespective of  
886 the *EndDevice:postRate*. This message serves as a heartbeat to determine a loss of  
887 communications.

888 The EVSE SHALL monitor the reception of this heartbeat message. If the EVSE fails to receive  
889 10 consecutive heartbeat messages, the EVSE SHALL consider this a loss of communications  
890 and SHALL revoke the authorization to discharge by setting *DefaultDERControl:opModEnergize*  
891 to false.

892 If the EVSE receives 3 consecutive heartbeat messages, the EVSE shall consider this a  
893 restoration of communications and SHALL authorize the PEV to discharge provided the PEV  
894 still satisfies the criteria of section 4.6.4.

895 If the PEV fails to successfully send the heartbeat message 10 consecutive times, the PEV  
896 considers this a loss of communications and SHALL cease to discharge per SAE J3072 section  
897 4.6.2.

898 If the PEV successfully sends the heartbeat message 3 consecutive times, the PEV considers  
899 this a resumption of communications and MAY start discharging as long as it is still authorized  
900 to do so (*DefaultDERControl:opModEnergize* is true).

#### 901 **4.8.1.2 EVSE Gatekeeper Function**

902 The EVSE SHALL open the contactor if the PEV is discharging when it has not been authorized  
903 or if it is discharging outside its authorized limits.

904 The EVSE SHALL open the contactor immediately if it detects the PEV is discharging prior to  
905 the EVSE authorizing it to discharge.

906 The EVSE can revoke a PEV’s authorization to discharge at any time based on its evaluation on  
907 the compliance of the PEV. Once the EVSE has revoked the PEV’s authorization to discharge,  
908 the PEV SHALL cease to discharge within 3 seconds.

909 **4.8.2 Coordinated Charging/Discharging**

910 SAE J3072 requires the implementation of this use case. Once authorization to discharge is  
911 obtained, the EVSE MUST be capable of sending the *DERControl:opModFixedW* to implement  
912 the charge/discharge function. The PEV MUST support the *DERControl:opModFixedW* function  
913 where a positive value represents PEV discharging, and a negative value represents PEV  
914 charging.

915 The PEV MUST send the additional monitoring information described in SAE J3072 section  
916 4.7.4 and SAE J3072 Table 17. The PEV MUST implement the IEEE 2030.5 mapping described  
917 in SAE J3072 Table C19.

918 **4.8.3 PEV Sleep/Wake Functions**

919 SAE J3072 does not directly address this issue. For this profile, if the PEV was authorized to  
920 discharge and now wants to enter sleep mode, it SHALL post an  
921 *EndDevice:DER:DERStatus:inverterStatus* enumeration value of “2 – sleeping” before it enters  
922 in sleep mode. In sleep mode, PEV SHALL NOT send any metrology or status information to  
923 the EVSE.

924 When the EVSE receives the *inverterStatus* of “2 – sleeping”, the EVSE SHALL revoke the  
925 PEV’s authorization to discharge by setting the *DefaultDERControl:opModEnergize* object to  
926 false.

927 Upon waking from sleep, the PEV SHALL first re-acquire all the Management Information from  
928 the EVSE in case any has changed while the PEV was sleeping. After re-acquiring the  
929 Management Information, the PEV SHALL post an *EndDevice:DER:DERStatus:inverterStatus*  
930 enumeration value of “0 – N/A” to indicate to the EVSE that the PEV is ready to resume  
931 authorization to discharge. After posting its *inverterStatus*, the PEV re-enters periodic  
932 operations.

933 Upon receiving the updated *EndDevice:DER:DERStatus:inverterStatus* enumeration value of “0  
934 – N/A” from the PEV, the EVSE MAY re-authorize the PEV to discharge if the PEV meets all the  
935 authorization criteria from section 4.6.4.

936 **4.9 Exceptions and Clarifications**

937 This section lists the requirements of this profile that supersede the requirements and  
938 recommendations of other standards.

939 **4.9.1 Management Information**

940 SAE J3072 allows the EVSE to assume the PEV is operating with IEEE 1547 defaults upon  
941 connection. This assumption allows the EVSE to only send Management Information controls  
942 that differ from the IEEE 1547 defaults.

943 To promote operational clarity, the EVSE SHALL provide **ALL** Management Information listed in  
944 SAE J3072 section 4.6.6.11 that are in effect for the site even when those values do not differ  
945 from the IEEE 1547 or SAE J3072 defaults.

946 IEEE 2030.5 does not have an explicit concept of enabling/disabling a control. For this profile, in  
947 the absence of a Management Information control, the PEV MUST disable that control.

948 In IEEE 2030.5, when there is no active DERControl or DefaultDERControl in effect for a given  
949 function, the state of that function defaults to the DER device’s default. However, for this profile,

950 when there is no active DERControl or DefaultDERControl in effect for a given function, the PEV  
951 shall disable that function.

#### 952 **4.9.2 Momentary Cessation Function**

953 SAE J3072 states Momentary Cessation for ride-through curves shall not be supported whereas  
954 IEEE 1547 mandates the support of this function.

955 To maintain compliance with IEEE 1547, the PEV and EVSE SHALL support the  
956 *opModHVRTMomentaryCessation* and *opModLVRTMomentaryCessation* curve controls.

#### 957 **4.9.3 Frequency Droop Function**

958 SAE J3072 states the default mode of operation for the Frequency Droop function is OFF  
959 (disabled). IEEE 1547 does not recognize an on/off control for this function – it assumes  
960 Frequency Droop is always ON (enabled).

961 To maintain compliance with IEEE 1547, the PEV SHALL use a default mode of operation for  
962 the Frequency Droop function of ON (enabled) using IEEE 1547 default values.

#### 963 **4.9.4 PEV Maximum Wh Setting**

964 SAE J3072 does not require the PEV to report the *EndDevice:DER:DERSettings:setMaxWh*  
965 resource.

966 Since this resource is needed as the reference for the state of charge percentage, the PEV  
967 SHALL include the *setMaxWh* resource as part of its *DERSettings*.

#### 968 **4.9.5 EVSE Nominal Voltage for Site Limits**

969 IEEE 2030.5 provides two possible resources for the EVSE to establish the site's nominal  
970 voltage: *SelfDevice:DER:DERSettings:setVRef* or *SelfDevice:DER:DERSettings:setVNOM*.

971 To promote consistency with IEEE 1547, the EVSE SHALL use the *setVRef* resource to  
972 establish the site's nominal voltage as this resource maps more closely to the IEEE 1547  
973 nominal voltage. The EVSE SHALL NOT include the *setVNOM* resource.

#### 974 **4.9.6 EVSE Active Power Site Limit**

975 The EVSE SHALL use its *SelfDevice:DER:DERSettings:WMax* resource to convey the Active  
976 Power limit to the PEV. To maintain compliance with IEEE 1547, the Active Power limit (WMax)  
977 is used instead of the Apparent Power limit (VAMax).

#### 978 **4.9.7 Reactive Power Control Priority**

979 IEEE 1547 states the following reactive power controls are mutually exclusive:

- 980
  - Constant Power Factor
  - Volt-Var
  - Watt-Var
  - Constant Reactive Power

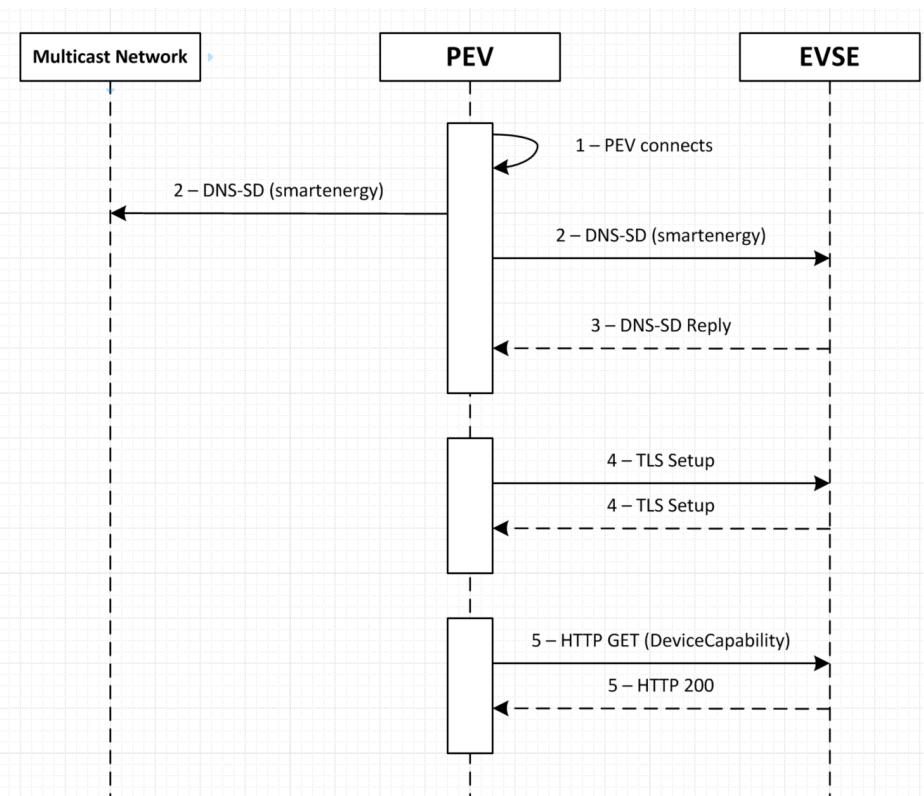

984 IEEE 1547 and SAE J3072 are silent on what happens if more than one of the above controls  
985 are sent to the DER. To avoid ambiguity and to maintain compliance with IEEE 1547, the EVSE  
986 SHALL NOT enable more than one of the reactive power controls listed above.

987 Note: This profile does not dictate the behavior of the PEV if the EVSE erroneously enables  
988 more than one reactive power control.

## 989 5 Informative Examples of IEEE 2030.5 Messages

### 990 5.1 Service Discovery

- 991 The PEV connects to the EVSE (1) and performs mDNS and DNS-SD (2,3) to discover the  
992 location of the *DeviceCapability* resource.  
993 The PEV and EVSE then perform TLS setup (4) to establish a secure connection.  
994 The PEV then gets the *DeviceCapability* resource (5).  
995

1001

Table 8 – DNS-SD Reply

1002 **5.2 Resource Discovery**

1003

PEV gets Device Capability.	<pre>GET /dcap HTTP/1.1 HTTP/1.1 200 OK  &lt;DeviceCapability xmlns="urn:ieee:std:2030.5:ns" href="/dcap" pollRate="15"&gt;   &lt;ResponseSetListLink href="/rsp" all="1"/&gt;   &lt;TimeLink href="/tm"/&gt;   &lt;UsagePointListLink href="/upt" all="1"/&gt;   &lt;EndDeviceListLink href="/edev" all="1"/&gt;   &lt;MirrorUsagePointListLink href="/mup" all="1"/&gt;   &lt;SelfDeviceLink href="/sdev"/&gt; &lt;/DeviceCapability&gt;</pre>
PEV gets Time.	<pre>GET /tm HTTP/1.1 HTTP/1.1 200 OK  &lt;Time xmlns="urn:ieee:std:2030.5:ns" href="/tm"&gt;   &lt;currentTime&gt;1670691660&lt;/currentTime&gt;   &lt;dstEndTime&gt;1667728800&lt;/dstEndTime&gt;   &lt;dstOffset&gt;3600&lt;/dstOffset&gt;   &lt;dstStartTime&gt;1647079200&lt;/dstStartTime&gt;   &lt;quality&gt;7&lt;/quality&gt;   &lt;tzOffset&gt;-28800&lt;/tzOffset&gt; &lt;/Time&gt;</pre>
PEV gets EndDeviceList.  This list contains the EndDevice for the PEV.	<pre>GET /edev HTTP/1.1 HTTP/1.1 200 OK  &lt;EndDeviceList xmlns="urn:ieee:std:2030.5:ns" href="/edev"   subscribable="0" all="1" results="1" pollRate="15"&gt;   &lt;EndDevice href="/edev/1"&gt;     &lt;DERListLink href="/edev/1/der" all="1"/&gt;     &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt;     &lt;DeviceInformationLink href="/edev/1/di"/&gt;     &lt;DeviceStatusLink href="/edev/1/dstat"/&gt;   &lt;/EndDevice&gt; &lt;/EndDeviceList&gt;</pre>

Since there is only one EndDevice instance, it is returned as part of the list response.	<pre> &lt;1FDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/1FDI&gt; &lt;PowerStatusLink href="/edev/1/pwrstat"/&gt; &lt;sFDI&gt;434902610920&lt;/sFDI&gt; &lt;changedTime&gt;1670691600&lt;/changedTime&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;FunctionSetAssignmentsListLink href="/pev/fsa" all="1"/&gt; &lt;postRate&gt;15&lt;/postRate&gt; &lt;SubscriptionListLink href="/edev/1/subs"/&gt; &lt;/EndDevice&gt; &lt;/EndDeviceList&gt;</pre>
PEV gets its DERList.  There is a single DER and we got it in the list response.  The EVSE should only provide 1 DER for the PEV.	<p>GET /edev HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;DERList xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der"   all="1" results="1" pollRate="15"&gt;   &lt;DER href="/edev/1/der/1"&gt;     &lt;DERAvailabilityLink href="/edev/1/der/1/dera"/&gt;     &lt;DERCapabilityLink href="/edev/1/der/1/dercap"/&gt;     &lt;DERSettingsLink href="/edev/1/der/1/derg"/&gt;     &lt;DERStatusLink href="/edev/1/der/1/ders"/&gt;   &lt;/DER&gt; &lt;/DERList&gt;</pre>

1004

Table 9 – Resource Discovery

1005 **5.3 PEV Gets Site Limits**

1006

PEV gets EVSE's SelfDevice.	<p>GET /sdev HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;SelfDevice xmlns="urn:ieee:std:2030.5:ns" href="/sdev"&gt;   &lt;DERListLink href="/sdev/der" all="1"/&gt;   &lt;deviceCategory&gt;020000&lt;/deviceCategory&gt;   &lt;1FDI&gt;702C9E51D2D02EFD488453A2BB684C205380B9CF&lt;/1FDI&gt;   &lt;sFDI&gt;301115568938&lt;/sFDI&gt; &lt;/SelfDevice&gt;</pre>
PEV gets the EVSE's DERList.  There is a single DER and we got it in the list response.  The EVSE should only provide 1 DER in its DERList.	<p>GET /sdev/der HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;DERList xmlns="urn:ieee:std:2030.5:ns" href="/sdev/der"   all="1" results="1" pollRate="15"&gt;   &lt;DER href="/sdev/der/1"&gt;     &lt;DERSettingsLink href="/sdev/der/1/derg"/&gt;   &lt;/DER&gt; &lt;/DERList&gt;</pre>

<p>PEV gets EVSE's DERSettings.</p> <p>This resource contains the site settings.</p>	<pre> GET /sdev/der/1/derg HTTP/1.1 HTTP/1.1 200 OK  &lt;DERSettings xmlns="urn:ieee:std:2030.5:ns"   href="/sdev/der/1/derg"&gt;   &lt;setGradW&gt;0&lt;/setGradW&gt;   &lt;setMaxChargeRateW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6500&lt;/value&gt;   &lt;/setMaxChargeRateW&gt;   &lt;setMaxV&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;250&lt;/value&gt;   &lt;/setMaxV&gt;   &lt;setMaxVar&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;3000&lt;/value&gt;   &lt;/setMaxVar&gt;   &lt;setMaxVarNeg&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;3000&lt;/value&gt;   &lt;/setMaxVarNeg&gt;   &lt;setMaxW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6500&lt;/value&gt;   &lt;/setMaxW&gt;   &lt;setMinV&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;200&lt;/value&gt;   &lt;/setMinV&gt;   &lt;setVRef&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;208&lt;/value&gt;   &lt;/setVRef&gt;   &lt;setVRef0fs&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;0&lt;/value&gt;   &lt;/setVRef0fs&gt;   &lt;updatedTime&gt;1668099600&lt;/updatedTime&gt; &lt;/DERSettings&gt; </pre>
--	--

## 1008 5.4 PEV Sends Info to EVSE

1009

PEV put its Device Information.	<pre>PUT /edev/1/di HTTP/1.1  &lt;DeviceInformation xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/di"&gt;   &lt;1FDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/1FDI&gt;   &lt;mfDate&gt;1606809600&lt;/mfDate&gt;   &lt;mfHwVer&gt;J3072 Certified&lt;/mfHwVer&gt;   &lt;mfID&gt;37250&lt;/mfID&gt;   &lt;mfInfo&gt;PEV Maker&lt;/mfInfo&gt;   &lt;mfModel&gt;ISM Value&lt;/mfModel&gt;   &lt;mfSerNum&gt;PEV VIN&lt;/mfSerNum&gt;   &lt;primaryPower&gt;2&lt;/primaryPower&gt;   &lt;secondaryPower&gt;0&lt;/secondaryPower&gt;   &lt;swActTime&gt;1668099600&lt;/swActTime&gt;   &lt;swVer&gt;PEV SW 1.0&lt;/swVer&gt; &lt;/DeviceInformation&gt;  HTTP/1.1 204 No Content</pre>
PEV puts its PowerStatus which contains the PEVInfo resource.	<pre>PUT /edev/1/pwrstat HTTP/1.1  &lt;PowerStatus xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/pwrstat"&gt;   &lt;batteryStatus&gt;1&lt;/batteryStatus&gt;   &lt;changedTime&gt;1670691670&lt;/changedTime&gt;   &lt;currentPowerSource&gt;2&lt;/currentPowerSource&gt;   &lt;PEVInfo&gt;     &lt;chargingPowerNow&gt;       &lt;multiplier&gt;0&lt;/multiplier&gt;       &lt;value&gt;6000&lt;/value&gt;     &lt;/chargingPowerNow&gt;     &lt;energyRequestNow&gt;       &lt;multiplier&gt;3&lt;/multiplier&gt;       &lt;value&gt;24&lt;/value&gt;     &lt;/energyRequestNow&gt;     &lt;maxForwardPower&gt;       &lt;multiplier&gt;0&lt;/multiplier&gt;       &lt;value&gt;6500&lt;/value&gt;     &lt;/maxForwardPower&gt;     &lt;minimumChargingDuration&gt;14400&lt;/minimumChargingDuration&gt;     &lt;targetStateOfCharge&gt;8500&lt;/targetStateOfCharge&gt;     &lt;timeChargeIsNeeded&gt;1670713200&lt;/timeChargeIsNeeded&gt;     &lt;timeChargingStatusPEV&gt;1670691670&lt;/timeChargingStatusPEV&gt;   &lt;/PEVInfo&gt; &lt;/PowerStatus&gt;  HTTP/1.1 204 No Content</pre>

1010

<p>PEV puts its DER Capability.</p> <p>These are the nameplate ratings for the PEV.</p>	<pre><code>PUT /edev/1/der/1/dercap HTTP/1.1  &lt;DERCapability xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/dercap"&gt;   &lt;modesSupported&gt;01DD69AB&lt;/modesSupported&gt;   &lt;rtgAbnormalCategory&gt;2&lt;/rtgAbnormalCategory&gt;   &lt;rtgMaxW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6500&lt;/value&gt;   &lt;/rtgMaxW&gt;   &lt;rtgNormalCategory&gt;1&lt;/rtgNormalCategory&gt;   &lt;rtgOverExcitedPF&gt;     &lt;displacement&gt;800&lt;/displacement&gt;     &lt;multiplier&gt;-3&lt;/multiplier&gt;   &lt;/rtgOverExcitedPF&gt;   &lt;rtgOverExcitedW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6000&lt;/value&gt;   &lt;/rtgOverExcitedW&gt;   &lt;rtgReactiveSusceptance&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;0&lt;/value&gt;   &lt;/rtgReactiveSusceptance&gt;   &lt;rtgUnderExcitedPF&gt;     &lt;displacement&gt;800&lt;/displacement&gt;     &lt;multiplier&gt;-3&lt;/multiplier&gt;   &lt;/rtgUnderExcitedPF&gt;   &lt;rtgUnderExcitedW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6000&lt;/value&gt;   &lt;/rtgUnderExcitedW&gt;   &lt;type&gt;81&lt;/type&gt; &lt;/DERCapability&gt;</code></pre> <p>HTTP/1.1 204 No Content</p>
<p>PEV puts its adjusted settings based on the site limits it got from the EVSE.</p> <p>These settings must be compatible with the EVSE site limit for the PEV to be authorized to discharge.</p>	<pre><code>PUT /edev/1/der/1/derg HTTP/1.1  &lt;DERSettings xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/derg"&gt;   &lt;modesEnabled&gt;01DD69AB&lt;/modesEnabled&gt;   &lt;setESDelay&gt;30000&lt;/setESDelay&gt;   &lt;setESHighFreq&gt;6100&lt;/setESHighFreq&gt;   &lt;setESHighVolt&gt;10500&lt;/setESHighVolt&gt;   &lt;setESLowFreq&gt;5900&lt;/setESLowFreq&gt;   &lt;setESLowVolt&gt;9500&lt;/setESLowVolt&gt;   &lt;setESRampTms&gt;6000&lt;/setESRampTms&gt;   &lt;setESRandomDelay&gt;0&lt;/setESRandomDelay&gt;   &lt;setGradW&gt;1000&lt;/setGradW&gt;   &lt;setMaxChargeRateVA&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6500&lt;/value&gt;   &lt;/setMaxChargeRateVA&gt;   &lt;setMaxChargeRateW&gt;     &lt;multiplier&gt;0&lt;/multiplier&gt;     &lt;value&gt;6500&lt;/value&gt;   &lt;/setMaxChargeRateW&gt;</code></pre>

HTTP/1.1 204 No Content

PEV put its DER Availability.	<pre>PUT /edev/1/der/1/dera HTTP/1.1  &lt;DERAvailability xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/dera"&gt;   &lt;availabilityDuration&gt;12000&lt;/availabilityDuration&gt;   &lt;maxChargeDuration&gt;18000&lt;/maxChargeDuration&gt;   &lt;readingTime&gt;1670691670&lt;/readingTime&gt;   &lt;reserveChargePercent&gt;2500&lt;/reserveChargePercent&gt;   &lt;reservePercent&gt;2500&lt;/reservePercent&gt; &lt;/DERAvailability&gt;  HTTP/1.1 204 No Content</pre>
PEV put its DERStatus.  In this update, the inverterStatus value is 3 indicating the PEV is not authorized to discharge	<pre>PUT /edev/1/der/1/ders HTTP/1.1  &lt;DERStatus xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/ders"&gt;   &lt;alarmStatus&gt;00&lt;/alarmStatus&gt;   &lt;genConnectStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;value&gt;02&lt;/value&gt;   &lt;/genConnectStatus&gt;   &lt;inverterStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;value&gt;3&lt;/value&gt;   &lt;/inverterStatus&gt;   &lt;operationalModeStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;value&gt;2&lt;/value&gt;   &lt;/operationalModeStatus&gt;   &lt;readingTime&gt;1670691670&lt;/readingTime&gt;   &lt;stateOfChargeStatus&gt;     &lt;dateTime&gt;1670691670&lt;/dateTime&gt;     &lt;value&gt;5000&lt;/value&gt;   &lt;/stateOfChargeStatus&gt; &lt;/DERStatus&gt;  HTTP/1.1 204 No Content</pre>

1012

Table 11 – PEV Sends Info to EVSE

1013

## 1014 5.5 PEV Gets Management Information

1015

<p>PEV gets its Function Set Assignments List.</p> <p>There is a single FSA and we got it in the list response.</p> <p>The EVSE should only provide 1 FSA for the PEV.</p>	<pre>GET /pev/fsa HTTP/1.1 HTTP/1.1 200 OK  &lt;FunctionSetAssignmentsList xmlns="urn:ieee:std:2030.5:ns" href="/pev/fsa"     subscribable="1" all="1" results="1" pollRate="15"&gt;     &lt;FunctionSetAssignments href="/pev/fsa/1"&gt;         &lt;DERProgramListLink href="/pev/derp" all="1"/&gt;         &lt;TimeLink href="/tm"/&gt;         &lt;mRID&gt;EFEF000100000000000000000000D17E&lt;/mRID&gt;         &lt;description&gt;PEV FSA&lt;/description&gt;     &lt;/FunctionSetAssignments&gt; &lt;/FunctionSetAssignmentsList&gt;</pre>
<p>PEV gets Time.</p>	<pre>GET /tm HTTP/1.1 HTTP/1.1 200 OK  &lt;Time xmlns="urn:ieee:std:2030.5:ns" href="/tm"&gt;     &lt;currentTime&gt;1670691660&lt;/currentTime&gt;     &lt;dstEndTime&gt;1667728800&lt;/dstEndTime&gt;     &lt;dstOffset&gt;3600&lt;/dstOffset&gt;     &lt;dstStartTime&gt;1647079200&lt;/dstStartTime&gt;     &lt;quality&gt;7&lt;/quality&gt;     &lt;tzOffset&gt;-28800&lt;/tzOffset&gt; &lt;/Time&gt;</pre>
<p>PEV gets its DER ProgramList.</p> <p>There is a single DERProgram and we got it in the list response.</p> <p>The EVSE should only provide 1 DERProgram for the PEV.</p>	<pre>GET /pev/derp HTTP/1.1 HTTP/1.1 200 OK  &lt;DERProgramList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp"     subscribable="1" all="1" results="1" pollRate="1"&gt;     &lt;DERProgram href="/pev/derp/1"&gt;         &lt;mRID&gt;DDDD000100000000000000000000D17E&lt;/mRID&gt;         &lt;description&gt;PEV DER Program&lt;/description&gt;         &lt;ActiveDERControlListLink href="/pev/derp/1/actderc" all="1"/&gt;         &lt;DefaultDERControlLink href="/pev/derp/1/dderc"/&gt;         &lt;DERControlListLink href="/pev/derp/1/derc" all="9"/&gt;         &lt;DERCurveListLink href="/pev/derp/1/dc" all="8"/&gt;         &lt;primacy&gt;2&lt;/primacy&gt;     &lt;/DERProgram&gt; &lt;/DERProgramList&gt;</pre>

1016

<p>PEV gets its DefaultDERControl.</p> <p>This resource contains the <i>opModEnergize</i> object which is the boolean that grants the PEV the authorization to discharge.</p>	<pre>GET /pev/derp/1/dderc HTTP/1.1 HTTP/1.1 200 OK  &lt;DefaultDERControl xmlns="urn:ieee:std:2030.5:ns"   href="/pev/derp/1/dderc" subscribable="1"&gt;   &lt;mRID&gt;DDDD00010001000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Default DERC&lt;/description&gt;   &lt;DERControlBase&gt;     &lt;opModEnergize&gt;false&lt;/opModEnergize&gt;   &lt;/DERControlBase&gt;   &lt;setESDelay&gt;30000&lt;/setESDelay&gt;   &lt;setESHighFreq&gt;6100&lt;/setESHighFreq&gt;   &lt;setESHighVolt&gt;10500&lt;/setESHighVolt&gt;   &lt;setESLowFreq&gt;5900&lt;/setESLowFreq&gt;   &lt;setESLowVolt&gt;9500&lt;/setESLowVolt&gt;   &lt;setESRampTms&gt;6000&lt;/setESRampTms&gt;   &lt;setESRandomDelay&gt;0&lt;/setESRandomDelay&gt; &lt;/DefaultDERControl&gt;</pre>
<p>PEV gets its DERControlList.</p> <p>Each Management Information function must have its own DERControl. In this example, there are 9 Management Information functions that are active for the site, so the DERControlList contains 9 entries.</p> <p>In this example, the PEV gets the list contents 3 at a time.</p> <p>This is the request for the first 3 list entries.</p>	<pre>GET /pev/derp/1/derc?s=0&amp;l=3 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc"   subscribable="1" all="9" results="3"&gt;   &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rspss/1/rsp"     responseRequired="07"&gt;     &lt;mRID&gt;CCCC000900000000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;MI-Freq-Droop&lt;/description&gt;     &lt;creationTime&gt;1670691600&lt;/creationTime&gt;     &lt;EventStatus&gt;       &lt;currentStatus&gt;1&lt;/currentStatus&gt;       &lt;dateTime&gt;1670691600&lt;/dateTime&gt;       &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt;     &lt;/EventStatus&gt;     &lt;interval&gt;       &lt;duration&gt;4294967295&lt;/duration&gt;       &lt;start&gt;1670691600&lt;/start&gt;     &lt;/interval&gt;     &lt;DERControlBase&gt;       &lt;opModFreqDroop&gt;         &lt;dBOF&gt;61000&lt;/dBOF&gt;         &lt;dBUF&gt;59000&lt;/dBUF&gt;         &lt;kOF&gt;100&lt;/kOF&gt;         &lt;kUF&gt;100&lt;/kUF&gt;         &lt;openLoopTms&gt;200&lt;/openLoopTms&gt;       &lt;/opModFreqDroop&gt;     &lt;/DERControlBase&gt;     &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt;   &lt;/DERControl&gt;   &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rspss/1/rsp"     responseRequired="07"&gt;     &lt;mRID&gt;CCCC000800000000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;MI-HVRT-Must&lt;/description&gt;     &lt;creationTime&gt;1670691600&lt;/creationTime&gt;     &lt;EventStatus&gt;</pre>

	<pre> &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt;   &lt;duration&gt;4294967295&lt;/duration&gt;   &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt;   &lt;opModHFRTMustTrip href="/pev/derp/1/dc/2"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp"   responseRequired="07"&gt;   &lt;mRID&gt;CCCC0007000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;MI-HVRT-MomCess&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;EventStatus&gt;     &lt;currentStatus&gt;1&lt;/currentStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt;   &lt;/EventStatus&gt;   &lt;interval&gt;     &lt;duration&gt;4294967295&lt;/duration&gt;     &lt;start&gt;1670691600&lt;/start&gt;   &lt;/interval&gt;   &lt;DERControlBase&gt;     &lt;opModHVRTMomentaryCessation href="/pev/derp/1/dc/4"/&gt;   &lt;/DERControlBase&gt;   &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;/DERControlList&gt; </pre>
In this example, the PEV gets the list contents 3 at a time.  This is the request for the middle 3 list entries.	<pre> GET /pev/derp/1/derc?s=3&amp;l=3 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc"   subscribable="1" all="9" results="3"&gt;   &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp"     responseRequired="07"&gt;     &lt;mRID&gt;CCCC0006000000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;MI-HVRT-Must&lt;/description&gt;     &lt;creationTime&gt;1670691600&lt;/creationTime&gt;     &lt;EventStatus&gt;       &lt;currentStatus&gt;1&lt;/currentStatus&gt;       &lt;dateTime&gt;1670691600&lt;/dateTime&gt;       &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt;     &lt;/EventStatus&gt;     &lt;interval&gt;       &lt;duration&gt;4294967295&lt;/duration&gt;       &lt;start&gt;1670691600&lt;/start&gt;     &lt;/interval&gt;     &lt;DERControlBase&gt;       &lt;opModHVRTMustTrip href="/pev/derp/1/dc/5"/&gt;     &lt;/DERControlBase&gt;   &lt;/DERControl&gt; &lt;/DERControlList&gt; </pre>

	<pre> &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC00050000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-LFRT-Must&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModLFRTMustTrip href="/pev/derp/1/dc/7"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC00040000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-LVRT-MomCess&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModLVRTMomentaryCessation href="/pev/derp/1/dc/9"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;/DERControlList&gt; </pre>
In this example, the PEV gets the list contents 3 at a time.  This is the request for the last 3 list entries.	<pre> GET /pev/derp/1/derc?s=0&amp;l=3 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc" subscribable="1" all="9" results="3"&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC00030000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-LVRT-Must&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; </pre>

	<pre> &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModLVRTMustTrip href="/pev/derp/1/dc/10"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rspss/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC000200000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-Volt-Var&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModVoltVar href="/pev/derp/1/dc/11"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rspss/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC000100000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-Volt-Watt&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670691600&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModVoltWatt href="/pev/derp/1/dc/12"/&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;/DERControlList&gt; </pre>

## 1018 5.6 PEV Gets Management Information Curves

1019

PEV gets the HFRT Must Trip curve.	<pre>GET /pev/derp/1/dc/2 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/2"&gt;   &lt;mRID&gt;EEEE00020000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;HFRT-Must&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;6300&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;6200&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;30000&lt;/xvalue&gt;     &lt;yvalue&gt;6200&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;30000&lt;/xvalue&gt;     &lt;yvalue&gt;6150&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;10000&lt;/xvalue&gt;     &lt;yvalue&gt;6150&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;2&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt;</pre>
------------------------------------	--

1020

PEV gets the HVRT Momentary Cessation curve.	<pre> GET /pev/derp/1/dc/4 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/4"&gt;   &lt;mRID&gt;EEEE0004000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;HVRT-MomCess&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;0&lt;/xvalue&gt;     &lt;yvalue&gt;11000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;1300&lt;/xvalue&gt;     &lt;yvalue&gt;11000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;4&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>
PEV gets the HVRT Must Trip curve.	<pre> GET /pev/derp/1/dc/5 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/5"&gt;   &lt;mRID&gt;EEEE0005000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;HVRT-Must&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;13000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;12000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;1300&lt;/xvalue&gt;     &lt;yvalue&gt;12000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;1300&lt;/xvalue&gt;     &lt;yvalue&gt;11000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;10000&lt;/xvalue&gt;     &lt;yvalue&gt;11000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;5&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>

PEV gets the LFRT Must Trip curve.	<pre> GET /pev/derp/1/dc/7 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/7"&gt;   &lt;mRID&gt;EEEE0007000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;LFRT-Must&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;0&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;16&lt;/xvalue&gt;     &lt;yvalue&gt;5650&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;30000&lt;/xvalue&gt;     &lt;yvalue&gt;5650&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;30000&lt;/xvalue&gt;     &lt;yvalue&gt;5850&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;100000&lt;/xvalue&gt;     &lt;yvalue&gt;5850&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;7&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>
PEV gets the LVRT Momentary Cessation curve.	<pre> GET /pev/derp/1/dc/9 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/9"&gt;   &lt;mRID&gt;EEEE000900000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;LVRT-MomCess&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;0&lt;/xvalue&gt;     &lt;yvalue&gt;5000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;150&lt;/xvalue&gt;     &lt;yvalue&gt;5000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;9&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>

PEV gets the LVRT Must Trip curve.	<pre> GET /pev/derp/1/dc/10 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/10"&gt;   &lt;mRID&gt;EEEE000A00000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;LVRT-Must&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;200&lt;/xvalue&gt;     &lt;yvalue&gt;0&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;200&lt;/xvalue&gt;     &lt;yvalue&gt;5000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;2100&lt;/xvalue&gt;     &lt;yvalue&gt;5000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;2100&lt;/xvalue&gt;     &lt;yvalue&gt;8800&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;10000&lt;/xvalue&gt;     &lt;yvalue&gt;8800&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;10&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>
PEV gets the Volt-Var curve.	<pre> GET /pev/derp/1/dc/11 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/11"&gt;   &lt;mRID&gt;EEEE000B00000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Volt-Var&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;9000&lt;/xvalue&gt;     &lt;yvalue&gt;10000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;9800&lt;/xvalue&gt;     &lt;yvalue&gt;0&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;10200&lt;/xvalue&gt;     &lt;yvalue&gt;0&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;11000&lt;/xvalue&gt;     &lt;yvalue&gt;-10000&lt;/yvalue&gt;   &lt;/CurveData&gt; &lt;/DERCurve&gt; </pre>

	<pre> &lt;/CurveData&gt; &lt;curveType&gt;11&lt;/curveType&gt; &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt; &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt; &lt;yRefType&gt;1&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>
PEV gets the Volt-Watt curve.	<p>GET /pev/derp/1/dc/12 HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;DERCurve xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dc/12"&gt;   &lt;mRID&gt;EEEE000C00000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Volt-Watt&lt;/description&gt;   &lt;creationTime&gt;1670691600&lt;/creationTime&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;10200&lt;/xvalue&gt;     &lt;yvalue&gt;10000&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;CurveData&gt;     &lt;xvalue&gt;11000&lt;/xvalue&gt;     &lt;yvalue&gt;0&lt;/yvalue&gt;   &lt;/CurveData&gt;   &lt;curveType&gt;12&lt;/curveType&gt;   &lt;xMultiplier&gt;-2&lt;/xMultiplier&gt;   &lt;yMultiplier&gt;-2&lt;/yMultiplier&gt;   &lt;yRefType&gt;0&lt;/yRefType&gt; &lt;/DERCurve&gt; </pre>

1021

Table 13 – PEV Gets Management Information Curves

1022

## 5.7 PEV Responses

1023

PEV posts its DERControl Response – Received for the first DERControl.  Since the event start time is in the past, the response is immediately sent.	<p>POST /rsps HTTP/1.1</p> <pre> &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;createdDateTime&gt;1670691680&lt;/createdDateTime&gt;   &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt;   &lt;status&gt;1&lt;/status&gt;   &lt;subject&gt;CCCC0001000000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/1 </pre>
--	--

1024

<p>PEV posts its DERControl Response – Received for the second DERControl.</p> <p>Since the event start time is in the past, the response is immediately sent.</p>	<pre><code>POST /rsps HTTP/1.1  &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;createdDateTime&gt;1670691680&lt;/createdDateTime&gt;   &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt;   &lt;status&gt;1&lt;/status&gt;   &lt;subject&gt;CCCC000200000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/2  # # Note: The Received responses to the other 7 DERControls are not shown. #</code></pre>
<p>PEV posts its DERControl Response – Started for the first DERControl.</p> <p>Since the event start time is in the past, the response is immediately sent.</p>	<pre><code>POST /rsps HTTP/1.1  &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;createdDateTime&gt;1670691680&lt;/createdDateTime&gt;   &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt;   &lt;status&gt;2&lt;/status&gt;   &lt;subject&gt;CCCC000100000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/10</code></pre>
<p>PEV posts its DERControl Response – Started for the second DERControl.</p> <p>Since the event start time is in the past, the response is immediately sent.</p>	<pre><code>POST /rsps HTTP/1.1  &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;createdDateTime&gt;1670691680&lt;/createdDateTime&gt;   &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt;   &lt;status&gt;2&lt;/status&gt;   &lt;subject&gt;CCCC000200000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/11  # # Note: The Started responses to the other 7 DERControls are not shown. #</code></pre>

## 1026 5.8 PEV Sets Up Metrology

1027

<p>PEV posts its Mirror Usage Point.</p> <p>The EVSE returns the location of the created MUP.</p> <p>The MUP contains one Mirror Meter Reading for Active Power.</p>	<pre><code>POST /mup HTTP/1.1  &lt;MirrorUsagePoint xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF0000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;PEV MUP&lt;/description&gt;   &lt;roleFlags&gt;04&lt;/roleFlags&gt;   &lt;serviceCategoryKind&gt;0&lt;/serviceCategoryKind&gt;   &lt;status&gt;1&lt;/status&gt;   &lt;deviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/deviceLFDI&gt;   &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;     &lt;mRID&gt;FFFF00010000000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;Active Power&lt;/description&gt;     &lt;ReadingType&gt;       &lt;accumulationBehaviour&gt;12&lt;/accumulationBehaviour&gt;       &lt;flowDirection&gt;1&lt;/flowDirection&gt;       &lt;phase&gt;128&lt;/phase&gt;       &lt;powerOfTenMultiplier&gt;0&lt;/powerOfTenMultiplier&gt;       &lt;uom&gt;38&lt;/uom&gt;     &lt;/ReadingType&gt;   &lt;/MirrorMeterReading&gt; &lt;/MirrorUsagePoint&gt;  HTTP/1.1 201 Created Location: /mup/1</code></pre>
<p>PEV gets the Mirror Usage Point.</p> <p>The PEV gets the MUP to see what the EVSE sets as the post rate for meter readings.</p>	<pre><code>GET /mup HTTP/1.1 HTTP/1.1 200 OK  &lt;MirrorUsagePointList xmlns="urn:ieee:std:2030.5:ns" href="/mup"   all="1" results="1" pollRate="15"&gt;   &lt;MirrorUsagePoint href="/mup/1"&gt;     &lt;mRID&gt;FFFF0000000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;PEV MUP&lt;/description&gt;     &lt;roleFlags&gt;04&lt;/roleFlags&gt;     &lt;serviceCategoryKind&gt;0&lt;/serviceCategoryKind&gt;     &lt;status&gt;1&lt;/status&gt;     &lt;deviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/deviceLFDI&gt;     &lt;postRate&gt;15&lt;/postRate&gt;   &lt;/MirrorUsagePoint&gt; &lt;/MirrorUsagePointList&gt;</code></pre>

1028

PEV creates the Active Power MMR.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00010000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Active Power&lt;/description&gt;   &lt;ReadingType&gt;     &lt;accumulationBehaviour&gt;12&lt;/accumulationBehaviour&gt;     &lt;flowDirection&gt;1&lt;/flowDirection&gt;     &lt;phase&gt;128&lt;/phase&gt;     &lt;powerOfTenMultiplier&gt;0&lt;/powerOfTenMultiplier&gt;     &lt;uom&gt;38&lt;/uom&gt;   &lt;/ReadingType&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/1</code></pre>
PEV creates the Reactive Power MMR.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF0002000000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Reactive Power&lt;/description&gt;   &lt;ReadingType&gt;     &lt;accumulationBehaviour&gt;12&lt;/accumulationBehaviour&gt;     &lt;flowDirection&gt;1&lt;/flowDirection&gt;     &lt;phase&gt;128&lt;/phase&gt;     &lt;powerOfTenMultiplier&gt;0&lt;/powerOfTenMultiplier&gt;     &lt;uom&gt;63&lt;/uom&gt;   &lt;/ReadingType&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/2</code></pre>
PEV creates the Voltage MMR.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF0003000000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Voltage&lt;/description&gt;   &lt;ReadingType&gt;     &lt;accumulationBehaviour&gt;12&lt;/accumulationBehaviour&gt;     &lt;phase&gt;128&lt;/phase&gt;     &lt;powerOfTenMultiplier&gt;-2&lt;/powerOfTenMultiplier&gt;     &lt;uom&gt;29&lt;/uom&gt;   &lt;/ReadingType&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/3</code></pre>

1029

PEV creates the Frequency MMR.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00040000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Frequency&lt;/description&gt;   &lt;ReadingType&gt;     &lt;accumulationBehaviour&gt;12&lt;/accumulationBehaviour&gt;     &lt;phase&gt;128&lt;/phase&gt;     &lt;powerOfTenMultiplier&gt;-2&lt;/powerOfTenMultiplier&gt;     &lt;uom&gt;33&lt;/uom&gt;   &lt;/ReadingType&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/4</code></pre>
PEV posts a new Active Power reading.  The update rate is set by the MeterUsagePoint: postRate.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00010000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Active Power&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691670&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;6000&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/1</code></pre>
PEV posts a new Reactive Power reading.  The update rate is set by the MeterUsagePoint: postRate.	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00020000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Reactive Power&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691670&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;0&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/2</code></pre>

1030

<p>PEV posts a new Voltage reading.</p> <p>The update rate is set by the MeterUsagePoint: postRate.</p>	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00030000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Voltage&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691670&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;20800&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/3</code></pre>
<p>PEV posts a new Frequency reading.</p> <p>The update rate is set by the MeterUsagePoint: postRate.</p>	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF000400000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Frequency&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691670&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;6000&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content Location: /upt/1/mr/4</code></pre>

## 1032 5.9 Subscriptions and Notifications

1033

<p>PEV creates a subscription to the DERControlList. The PEV specifies a limit of 1, so that the first DERControl in the list is sent in the Notification.</p>	<pre><code>POST /edev/1/subs HTTP/1.1  &lt;Subscription xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;subscribedResource&gt;/pev/derp/1/derc&lt;/subscribedResource&gt;   &lt;encoding&gt;0&lt;/encoding&gt;   &lt;level&gt;+S1&lt;/level&gt;   &lt;limit&gt;1&lt;/limit&gt;   &lt;notificationURI&gt;     <a href="https://[fd12:3456:789a:1::2]:443/ntfy">https://[fd12:3456:789a:1::2]:443/ntfy</a>   &lt;/notificationURI&gt; &lt;/Subscription&gt;  HTTP/1.1 201 Created Location: /edev/1/subs/1</code></pre>
<p>EVSE posts a Notification to the PEV. The Notification is a change to the DERControlList caused by the creating of a new DERControl.</p>	<pre><code>POST https://[fd12:3456:789a:1::2]:443/ntfy HTTP/1.1  &lt;Notification xmlns="urn:ieee:std:2030.5:ns"   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"&gt;   &lt;subscribedResource&gt;/pev/derp/1/derc&lt;/subscribedResource&gt;   &lt;Resource xsi:type="DERControlList"     href="/pev/derp/1/derc" subscribable="1" all="9" results="1"&gt;     &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp"       responseRequired="07"&gt;       &lt;mRID&gt;CCCC00090000000000000000000000D17E&lt;/mRID&gt;       &lt;description&gt;MI-Freq-Droop&lt;/description&gt;       &lt;creationTime&gt;1670691600&lt;/creationTime&gt;       &lt;EventStatus&gt;         &lt;currentStatus&gt;1&lt;/currentStatus&gt;         &lt;dateTime&gt;1670691600&lt;/dateTime&gt;         &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt;       &lt;/EventStatus&gt;       &lt;interval&gt;         &lt;duration&gt;4294967295&lt;/duration&gt;         &lt;start&gt;1670691600&lt;/start&gt;       &lt;/interval&gt;       &lt;DERControlBase&gt;         &lt;opModFreqDroop&gt;           &lt;dBOF&gt;61000&lt;/dBOF&gt;           &lt;dBUF&gt;59000&lt;/dBUF&gt;           &lt;kOF&gt;100&lt;/kOF&gt;           &lt;kUF&gt;100&lt;/kUF&gt;           &lt;openLoopTms&gt;200&lt;/openLoopTms&gt;         &lt;/opModFreqDroop&gt;       &lt;/DERControlBase&gt;       &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt;     &lt;/DERControl&gt;   &lt;/Resource&gt;   &lt;status&gt;0&lt;/status&gt;   &lt;subscriptionURI&gt;     <a href="https://[fd12:3456:789a:1::1]:443/edev/1/subs/1">https://[fd12:3456:789a:1::1]:443/edev/1/subs/1</a>   &lt;/subscriptionURI&gt; &lt;/Notification&gt;</code></pre>

	<pre> &lt;/subscriptionURI&gt; &lt;/Notification&gt;  HTTP/1.1 201 Created  # # Note: The notification returns the first DERControl in the list. The PEV # client would need to GET the remaining 8 DERControls from the list. The # examples in section 5.4 show how to page through the list 3 at a time. # </pre>
PEV creates a subscription to the Default DERControl.	<p>POST /edev/1/subs HTTP/1.1</p> <pre> &lt;Subscription xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;subscribedResource&gt;/pev/derp/1/dderc&lt;/subscribedResource&gt;   &lt;encoding&gt;0&lt;/encoding&gt;   &lt;level&gt;+S1&lt;/level&gt;   &lt;limit&gt;1&lt;/limit&gt;   &lt;notificationURI&gt;     <a href="https://[fd12:3456:789a:1::2]:443/ntfy">https://[fd12:3456:789a:1::2]:443/ntfy</a>   &lt;/notificationURI&gt; &lt;/Subscription&gt;  HTTP/1.1 201 Created Location: /edev/1/subs/2 </pre>
EVSE posts a Notification to the PEV.  The Notification is a change to the Default DERControl.  The PEV specifies a limit of 1, so that the Default DERControl is included in the Notification.	<p>POST <a href="https://[fd12:3456:789a:1::2]:443/ntfy">https://[fd12:3456:789a:1::2]:443/ntfy</a> HTTP/1.1</p> <pre> &lt;Notification xmlns="urn:ieee:std:2030.5:ns"   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"&gt;   &lt;subscribedResource&gt;/pev/derp/1/derc&lt;/subscribedResource&gt;   &lt;Resource xsi:type="DefaultDERControl" xmlns="urn:ieee:std:2030.5:ns"     href="/pev/derp/1/dderc" subscribable="1"&gt;     &lt;mRID&gt;DDDD0001000100000000000000D17E&lt;/mRID&gt;     &lt;description&gt;Default DERC&lt;/description&gt;     &lt;DERControlBase&gt;       &lt;opModEnergize&gt;false&lt;/opModEnergize&gt;     &lt;/DERControlBase&gt;     &lt;setESDelay&gt;30000&lt;/setESDelay&gt;     &lt;setESHHighFreq&gt;6100&lt;/setESHHighFreq&gt;     &lt;setESHHighVolt&gt;10500&lt;/setESHHighVolt&gt;     &lt;setESLowFreq&gt;5900&lt;/setESLowFreq&gt;     &lt;setESLowVolt&gt;9500&lt;/setESLowVolt&gt;     &lt;setESRampTms&gt;6000&lt;/setESRampTms&gt;     &lt;setESRandomDelay&gt;0&lt;/setESRandomDelay&gt;   &lt;/Resource&gt;   &lt;status&gt;0&lt;/status&gt;   &lt;subscriptionURI&gt;     <a href="https://[fd12:3456:789a:1::1]:443/edev/1/subs/2">https://[fd12:3456:789a:1::1]:443/edev/1/subs/2</a> Error! 1035 **5.10 Periodic Gets of Information**

1036

<p>PEV gets the Default DERControl every 1 second if it has not subscribed to the resource.</p>	<pre>GET /pev/derp/1/dderc HTTP/1.1 HTTP/1.1 200 OK  &lt;DefaultDERControl xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/dderc" subscribable="1"&gt; &lt;mRID&gt;DDDD0001000100000000000000D17E&lt;/mRID&gt; &lt;description&gt;Default DERC&lt;/description&gt; &lt;DERControlBase&gt;   &lt;opModEnergize&gt;false&lt;/opModEnergize&gt; &lt;/DERControlBase&gt; &lt;setESDelay&gt;30000&lt;/setESDelay&gt; &lt;setESHighFreq&gt;6100&lt;/setESHighFreq&gt; &lt;setESHighVolt&gt;10500&lt;/setESHighVolt&gt; &lt;setESLowFreq&gt;5900&lt;/setESLowFreq&gt; &lt;setESLowVolt&gt;9500&lt;/setESLowVolt&gt; &lt;setESRampTms&gt;6000&lt;/setESRampTms&gt; &lt;setESRandomDelay&gt;0&lt;/setESRandomDelay&gt; &lt;/DefaultDERControl&gt;</pre>
<p>PEV gets the DERControlList every 1 second if it has not subscribed to the resource.</p> <p>The key purpose is to monitor for changes to the Management Information controls.</p> <p>The PEV shall stop discharging if it cannot comply with any Management Information values.</p>	<pre>GET /pev/derp/1/derc HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc" subscribable="1" all="9" results="1"&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsp/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC00090000000000000000000000D17E&lt;/mRID&gt; &lt;description&gt;MI-Freq-Droop&lt;/description&gt; &lt;creationTime&gt;1670691600&lt;/creationTime&gt; &lt;EventStatus&gt;   &lt;currentStatus&gt;1&lt;/currentStatus&gt;   &lt;dateTime&gt;1670691600&lt;/dateTime&gt;   &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt;   &lt;duration&gt;4294967295&lt;/duration&gt;   &lt;start&gt;1670691600&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt;   &lt;opModFreqDroop&gt;     &lt;dBOF&gt;61000&lt;/dBOF&gt;     &lt;dBUF&gt;59000&lt;/dBUF&gt;     &lt;kOF&gt;100&lt;/kOF&gt;     &lt;kUF&gt;100&lt;/kUF&gt;     &lt;openLoopTms&gt;200&lt;/openLoopTms&gt;   &lt;/opModFreqDroop&gt;</pre>

	<pre> &lt;/DERControlBase&gt;   &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;/DERControlList&gt;  # # Note: The queries for the other 8 DERControls in the list are not shown. # </pre>
PEV monitors its EndDevice instance.  The primary purpose is to detect changes to the postRate.	<p>GET /edev/1 HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;EndDevice xmlns="urn:ieee:std:2030.5:ns" href="/edev/1"&gt;   &lt;DERListLink href="/edev/1/der" all="1"/&gt;   &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt;   &lt;DeviceInformationLink href="/edev/1/di"/&gt;   &lt;DeviceStatusLink href="/edev/1/dstat"/&gt;   &lt;lFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/lFDI&gt;   &lt;PowerStatusLink href="/edev/1/pwrstat"/&gt;   &lt;sFDI&gt;434902610920&lt;/sFDI&gt;   &lt;changedTime&gt;1670691600&lt;/changedTime&gt;   &lt;enabled&gt;true&lt;/enabled&gt;   &lt;FunctionSetAssignmentsListLink href="/pev/fsa" all="1"/&gt;   &lt;postRate&gt;15&lt;/postRate&gt;   &lt;SubscriptionListLink href="/edev/1/subs"/&gt; &lt;/EndDevice&gt; </pre>
PEV monitors its MUP instance.  The primary purpose is to detect changes to the postRate.	<p>GET /mup/1 HTTP/1.1 HTTP/1.1 200 OK</p> <pre> &lt;MirrorUsagePoint xmlns="urn:ieee:std:2030.5:ns" href="/mup/1"&gt;   &lt;mRID&gt;FFFF00010000000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;PEV MUP&lt;/description&gt;   &lt;roleFlags&gt;04&lt;/roleFlags&gt;   &lt;serviceCategoryKind&gt;0&lt;/serviceCategoryKind&gt;   &lt;status&gt;1&lt;/status&gt;   &lt;deviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/deviceLFDI&gt;   &lt;postRate&gt;15&lt;/postRate&gt; &lt;/MirrorUsagePoint&gt; </pre>

## 1038 5.11 PEV Sends Periodic Information

1039

<p>PEV puts its DERStatus every 1 second.</p> <p>Posting of this resource is used as a heartbeat message for loss of communications detection.</p> <p>In this update, the inverterStatus value is 0 indicating the PEV is authorized to discharge.</p>	<pre><code>PUT /edev/1/der/1/ders HTTP/1.1  &lt;DERStatus xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/ders"&gt;   &lt;alarmStatus&gt;00&lt;/alarmStatus&gt;   &lt;genConnectStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;value&gt;02&lt;/value&gt;   &lt;/genConnectStatus&gt;   &lt;inverterStatus&gt;     &lt;dateTime&gt;1670691685&lt;/dateTime&gt;     &lt;value&gt;3&lt;/value&gt;   &lt;/inverterStatus&gt;   &lt;operationalModeStatus&gt;     &lt;dateTime&gt;1670691600&lt;/dateTime&gt;     &lt;value&gt;2&lt;/value&gt;   &lt;/operationalModeStatus&gt;   &lt;readingTime&gt;1670691685&lt;/readingTime&gt;   &lt;stateOfChargeStatus&gt;     &lt;dateTime&gt;1670691685&lt;/dateTime&gt;     &lt;value&gt;5001&lt;/value&gt;   &lt;/stateOfChargeStatus&gt; &lt;/DERStatus&gt;  HTTP/1.1 204 No Content</code></pre>
<p>PEV puts its PowerStatus which contains the PEVInfo resource.</p>	<pre><code>PUT /edev/1/pwrstat HTTP/1.1  &lt;PowerStatus xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/pwrstat"&gt;   &lt;batteryStatus&gt;1&lt;/batteryStatus&gt;   &lt;changedTime&gt;1670691685&lt;/changedTime&gt;   &lt;currentPowerSource&gt;2&lt;/currentPowerSource&gt;   &lt;PEVInfo&gt;     &lt;chargingPowerNow&gt;       &lt;multiplier&gt;0&lt;/multiplier&gt;       &lt;value&gt;6000&lt;/value&gt;     &lt;/chargingPowerNow&gt;     &lt;energyRequestNow&gt;       &lt;multiplier&gt;3&lt;/multiplier&gt;       &lt;value&gt;24&lt;/value&gt;     &lt;/energyRequestNow&gt;     &lt;maxForwardPower&gt;       &lt;multiplier&gt;0&lt;/multiplier&gt;       &lt;value&gt;6500&lt;/value&gt;     &lt;/maxForwardPower&gt;     &lt;minimumChargingDuration&gt;14400&lt;/minimumChargingDuration&gt;     &lt;targetStateOfCharge&gt;8500&lt;/targetStateOfCharge&gt;     &lt;timeChargeIsNeeded&gt;1670713200&lt;/timeChargeIsNeeded&gt;     &lt;timeChargingStatusPEV&gt;1670691685&lt;/timeChargingStatusPEV&gt;   &lt;/PEVInfo&gt; &lt;/PowerStatus&gt;</code></pre>

	<code>HTTP/1.1 204 No Content</code>
PEV put its DER Availability.	<pre>PUT /edev/1/der/1/dera HTTP/1.1  &lt;DERAvailability xmlns="urn:ieee:std:2030.5:ns" href="/edev/1/der/1/dera"&gt;   &lt;availabilityDuration&gt;12000&lt;/availabilityDuration&gt;   &lt;maxChargeDuration&gt;18000&lt;/maxChargeDuration&gt;   &lt;readingTime&gt;1670691685&lt;/readingTime&gt;   &lt;reserveChargePercent&gt;2500&lt;/reserveChargePercent&gt;   &lt;reservePercent&gt;2500&lt;/reservePercent&gt; &lt;/DERAvailability&gt;  HTTP/1.1 204 No Content</pre>
PEV posts its Meter Readings – Active Power.  The update rate is set by the MeterUsagePoint: postRate.	<pre>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00010000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Active Power&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691685&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;5975&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content</pre>
PEV posts its Meter Readings – Reactive Power.  The update rate is set by the MeterUsagePoint: postRate.	<pre>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00020000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Reactive Power&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691685&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;0&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content</pre>

1040

<p>PEV posts its Meter Readings – Voltage.</p> <p>The update rate is set by the MeterUsagePoint: postRate.</p>	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF00030000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Voltage&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691685&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;20825&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content</code></pre>
<p>PEV posts its Meter Readings – Frequency.</p> <p>The update rate is set by the MeterUsagePoint: postRate.</p>	<pre><code>POST /mup/1 HTTP/1.1  &lt;MirrorMeterReading xmlns="urn:ieee:std:2030.5:ns"&gt;   &lt;mRID&gt;FFFF000400000000000000000000D17E&lt;/mRID&gt;   &lt;description&gt;Frequency&lt;/description&gt;   &lt;Reading&gt;     &lt;timePeriod&gt;       &lt;duration&gt;0&lt;/duration&gt;       &lt;start&gt;1670691685&lt;/start&gt;     &lt;/timePeriod&gt;     &lt;value&gt;6001&lt;/value&gt;   &lt;/Reading&gt; &lt;/MirrorMeterReading&gt;  HTTP/1.1 204 No Content</code></pre>

## 1042 5.12 Other Functions

1043

<p>PEV gets new DERControl.</p> <p>The new DERControl contains the <i>opModMaxLimW</i> control to adjust the Active Power limit for the site.</p>	<pre>GET /pev/derp/1/derc?s=1 HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc" subscribable="1" all="10" results="1"&gt; &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsps/1/rsp" responseRequired="07"&gt; &lt;mRID&gt;CCCC000A000000000000000000D17E&lt;/mRID&gt; &lt;description&gt;Dynamic Active Power Limit&lt;/description&gt; &lt;creationTime&gt;1670695200&lt;/creationTime&gt; &lt;EventStatus&gt; &lt;currentStatus&gt;1&lt;/currentStatus&gt; &lt;dateTime&gt;1670695200&lt;/dateTime&gt; &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt; &lt;/EventStatus&gt; &lt;interval&gt; &lt;duration&gt;4294967295&lt;/duration&gt; &lt;start&gt;1670695200&lt;/start&gt; &lt;/interval&gt; &lt;DERControlBase&gt; &lt;opModMaxLimW&gt;5000&lt;/opModMaxLimW&gt; &lt;/DERControlBase&gt; &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt; &lt;/DERControl&gt; &lt;/DERControlList&gt;</pre>
<p>PEV posts its DERControl Response – Received.</p> <p>Since the event start time is in the past, the response is immediately sent.</p>	<pre>POST /rsps HTTP/1.1  &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt; &lt;createdDateTime&gt;1670695205&lt;/createdDateTime&gt; &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt; &lt;status&gt;1&lt;/status&gt; &lt;subject&gt;CCCC000A000000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/19</pre>
<p>PEV posts its DERControl Response - Started</p> <p>Since the event start time is in the past, the response is immediately sent.</p>	<pre>POST /rsps HTTP/1.1  &lt;DERControlResponse xmlns="urn:ieee:std:2030.5:ns"&gt; &lt;createdDateTime&gt;1670695205&lt;/createdDateTime&gt; &lt;endDeviceLFDI&gt;A2038B8645F15C66D889FFBC4352AC0B8CDACBA1&lt;/endDeviceLFDI&gt; &lt;status&gt;2&lt;/status&gt; &lt;subject&gt;CCCC000A000000000000000000000000D17E&lt;/subject&gt; &lt;/DERControlResponse&gt;  HTTP/1.1 201 Created Location: /rsps/1/rsp/20</pre>

<p>PEV gets new DERControl.</p> <p>The new DERControl contains the <i>opModFixedW</i> control to coordinated charging and discharging.</p>	<pre>GET /pev/derp/1/derc HTTP/1.1 HTTP/1.1 200 OK  &lt;DERControlList xmlns="urn:ieee:std:2030.5:ns" href="/pev/derp/1/derc"   subscribable="1" all="11" results="1"&gt;   &lt;DERControl href="/pev/derp/1/derc/1" replyTo="/rsps/1/rsp"     responseRequired="07"&gt;     &lt;mRID&gt;CCCC000B000000000000000000D17E&lt;/mRID&gt;     &lt;description&gt;Active Power Setpoint&lt;/description&gt;     &lt;creationTime&gt;1670698800&lt;/creationTime&gt;     &lt;EventStatus&gt;       &lt;currentStatus&gt;1&lt;/currentStatus&gt;       &lt;dateTime&gt;1670698800&lt;/dateTime&gt;       &lt;potentiallySuperseded&gt;false&lt;/potentiallySuperseded&gt;     &lt;/EventStatus&gt;     &lt;interval&gt;       &lt;duration&gt;4294967295&lt;/duration&gt;       &lt;start&gt;1670698800&lt;/start&gt;     &lt;/interval&gt;     &lt;DERControlBase&gt;       &lt;opModFixedW&gt;2500&lt;/opModFixedW&gt;     &lt;/DERControlBase&gt;     &lt;deviceCategory&gt;010000&lt;/deviceCategory&gt;   &lt;/DERControl&gt; &lt;/DERControlList&gt;</pre>
